

General Description

The 810252I is a high performance, low jitter/low phase noise VCXO. The 810252I uses a low frequency and low cost pullable crystal to achieve jitter attenuation for synchronous Ethernet applications. The 810252I can take an input of 25MHz and produce two LVCMOS outputs of 25MHz.

The device is packaged in a small 16 lead TSSOP package and is ideal for use on space constrained boards typically encountered in most synchronous ethernet applications.

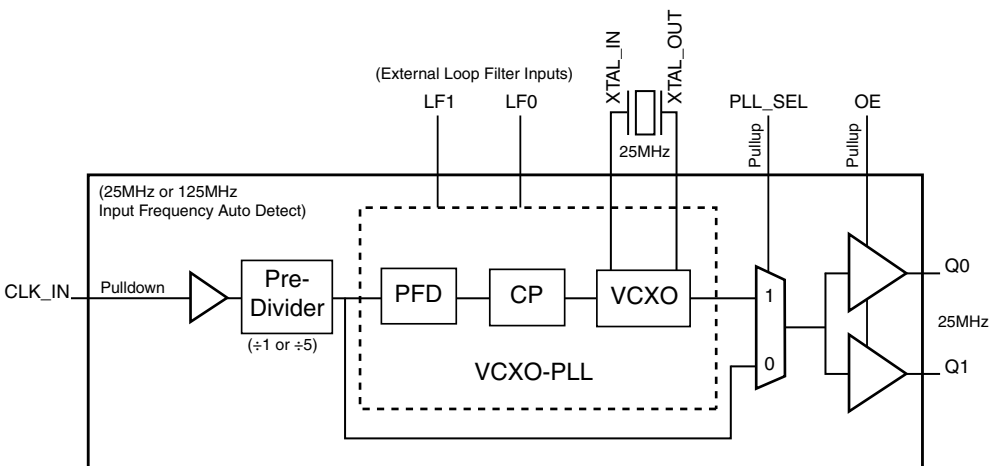

Applications

- Synchronous Ethernet v0.39a
- End equipment compliant with Std IEEE 802.039a

Features

- Two single-ended outputs (LVCMOS or LVTTTL levels), output Impedance: 15Ω
- Phase jitter attenuation by the VCXO-PLL using a 25MHz pullable external crystal (XTAL)
- Input frequencies: 25MHz or 125MHz
- Output frequency: 25MHz
- PLL loop bandwidth adjustable by external components
- Full 3.3V or 2.5V supply voltage
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) package

Table 1. Pin Descriptions

Number	Name	Type		Description
1	PLL_SEL	Input	Pullup	When logic HIGH, the VCXO-PLL is enabled. When LOW, the VCXO-PLL is in bypass mode. LVCMOS/LVTTL interface levels.
2, 9, 12	GND	Power		Power supply ground.
3, 4	Q0, Q1	Output		Single-ended clock outputs. LVCMOS/ LVTTL interface levels.
5	V _{DDO}	Power		Output power supply pin.
6	OE	Input	Pullup	Output enable pin for Qx outputs. LVCMOS/LVTTL interface levels.
7	V _{DDA}	Power		Analog supply pin.
8, 15	V _{DD}	Power		Core supply pins.
10, 11	XTAL_OUT, XTAL_IN	Input		VCXO crystal oscillator interface. XTAL_IN is the input. XTAL_OUT is the output.
13, 14	LF0, LF1	Analog Input/ Output		Loop filter connection node pins.
16	CLK_IN	Input	Pulldown	Single-ended clock input. LVCMOS/LVTTL interface levels.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 2, *Pin Characteristics*, for typical values.

Table 2. Pin Characteristics

Recommendations for Unused Input Pins

Inputs:

LVC MOS Control Pins

All control pins have internal pullups; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

Outputs:

LVC MOS Outputs

All unused LVC MOS outputs can be left floating. There should be no trace attached.

Schematic Example

Figure 1 shows an example of 810252I application schematic. In this example, the device is operated at $V_{DD} = 3.3V$. The decoupling capacitors should be as close as possible to the power pin. The input is driven by an LVCMOS driver. An optional 3-pole filter can

also be used for additional spur reduction. It is recommended that the loop filter components be laid out for the 3-pole option. This will also allow the 2-pole filter to be used.

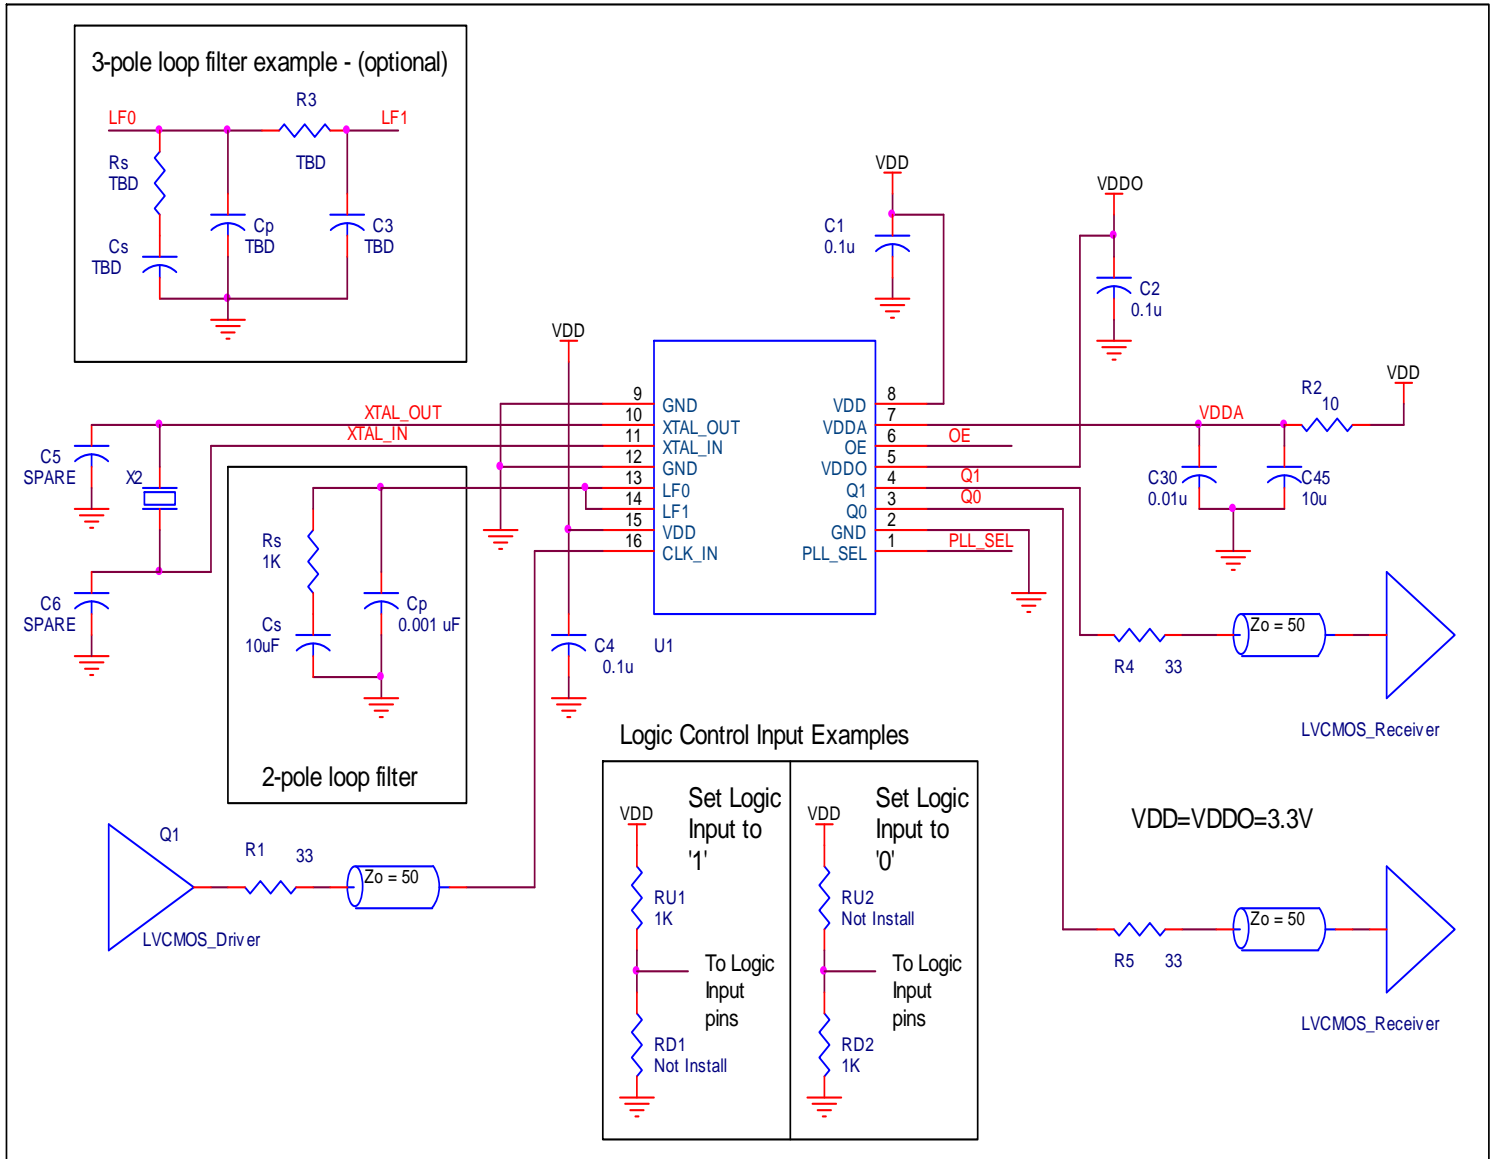

Figure 1. 810252I Schematic Example

VCXO-PLL EXTERNAL COMPONENTS

Choosing the correct external components and having a proper printed circuit board (PCB) layout is a key task for quality operation of the VCXO-PLL. In choosing a crystal, special precaution must be taken with the package and load capacitance (C_L). In addition, frequency, accuracy and temperature range must also be considered. Since the pulling range of a crystal also varies with the package, it is recommended that a metal-canned package like HC49 be used. Generally, a metal-canned package has a larger pulling range than a surface mounted device (SMD). For crystal selection information, refer to the *VCXO Crystal Selection Application Note*.

The crystal's load capacitance C_L characteristic determines its resonating frequency and is closely related to the VCXO tuning range. The total external capacitance seen by the crystal when installed on a board is the sum of the stray board capacitance, IC package lead capacitance, internal varactor capacitance and any installed tuning capacitors (C_{TUNE}).

If the crystal C_L is greater than the total external capacitance, the VCXO will oscillate at a higher frequency than the crystal specification. If the crystal C_L is lower than the total external capacitance, the VCXO will oscillate at a lower frequency than the crystal specification. In either case, the absolute tuning range is reduced. The correct value of C_L is dependant on the characteristics of the VCXO. The recommended C_L in the *Crystal Parameter Table* balances the tuning range by centering the tuning curve.

The frequency of oscillation in the third overtone mode is not necessarily at exactly three times the fundamental frequency. The mechanical properties of the quartz element dictate the position of the overtones relative to the fundamental. The oscillator circuit may excite both the fundamental and overtone modes simultaneously. This will cause a nonlinearity in the tuning curve. This potential problem is why VCXO crystals are required to be tested for absence of any activity inside a ± 200 ppm window at three times the fundamental frequency. Refer to F_{L_3OVT} and $F_{L_3OVT_spurs}$ in the crystal Characteristics table.

The crystal and external loop filter components should be kept as close as possible to the device. Loop filter and crystal traces should be kept short and separated from each other. Other signal traces should be kept separate and not run underneath the device, loop filter or crystal components.

VCXO Characteristics Table

Symbol	Parameter	Typical	Units
k_{VCXO}	VCXO Gain	15000	Hz/V
C_{V_LOW}	Low Varactor Capacitance	9.8	pF
C_{V_HIGH}	High Varactor Capacitance	22.7	pF

VCXO-PLL Loop Bandwidth Selection Table

Bandwidth	Crystal Frequency (MHz)	R_S (k Ω)	C_S (μ F)	C_P (μ F)
215Hz (Low)	25	0.4	10	0.01
537Hz (Mid)	25	1.0	10	0.001
886Hz (High)	25	1.65	10	0.001

Power Considerations

This section provides information on power dissipation and junction temperature for the 810252I. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the 810252I is the sum of the core power plus the analog power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 5\% = 3.465V$, which gives worst case results.

- Power (core)_{MAX} = $V_{DD_MAX} * (I_{DD} + I_{DDA} + I_{DDO}) = 3.465V * (40mA + 7mA + 5mA) = \mathbf{180.18mW}$
- Output Impedance R_{OUT} Power Dissipation due to Loading 50Ω to $V_{DD}/2$
Output Current $I_{OUT} = V_{DD_MAX} / [2 * (50\Omega + R_{OUT})] = 3.465V / [2 * (50\Omega + 15\Omega)] = \mathbf{26.7mA}$
- Power Dissipation on the R_{OUT} per LVCMOS output
Power (R_{OUT}) = $R_{OUT} * (I_{OUT})^2 = 15\Omega * (26.7mA)^2 = \mathbf{10.7mW}$ per output
- Total Power (R_{OUT}) = $10.7mW * 2 = \mathbf{21.4mW}$

Dynamic Power Dissipation at 25MHz

$$\text{Power (25MHz)} = C_{PD} * \text{Frequency} * (V_{DD})^2 = 8pF * 25MHz * (3.465V)^2 = \mathbf{2.4mW}$$
 per output

$$\text{Total Power (25MHz)} = 2.4mW * 2 = \mathbf{4.8mW}$$

Total Power Dissipation

- **Total Power**
= Power (core)_{MAX} + Power (R_{OUT}) + Power (25MHz)
= $180.18mW + 21.4mW + 4.8mW$
= $\mathbf{206.38mW}$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad directly affects the reliability of the device. The maximum recommended junction temperature is 125°C . Limiting the internal transistor junction temperature, T_j , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C .

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_{total} + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_{total} = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 81.2°C/W per Table 5 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ\text{C} + 0.296W * 81.2^\circ\text{C/W} = 101.7^\circ\text{C}. \text{ This is well below the limit of } 125^\circ\text{C}.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 5. Thermal Resistance θ_{JA} for 16 Lead TSSOP, Forced Convection

Meters per Second	θ_{JA} by Velocity		
	0	1	2.5
