

### GENERAL DESCRIPTION

The 843034I-06 is a general purpose, low phase noise LVPECL synthesizer which can generate frequencies for a wide variety of applications. The 843034I-06 has a 4:1 input multiplexer from which the following inputs can be selected: one differential input, one single-ended input, or one of two crystal oscillators, thus making the device ideal for frequency translation or frequency generation. The 843034I-06 has dual LVPECL outputs that may be programmed for ÷2, ÷4 or ÷5 of the VCO frequency. The 843034I-06 also supplies a buffered copy of the reference clock or crystal frequency on the single-ended REF\_OUT pin which can be enabled or disabled (disabled by default). The output frequency can be programmed using either a serial or parallel programming interface. This device supports Spread Spectrum Clocking (SSC) for EMI reduction.

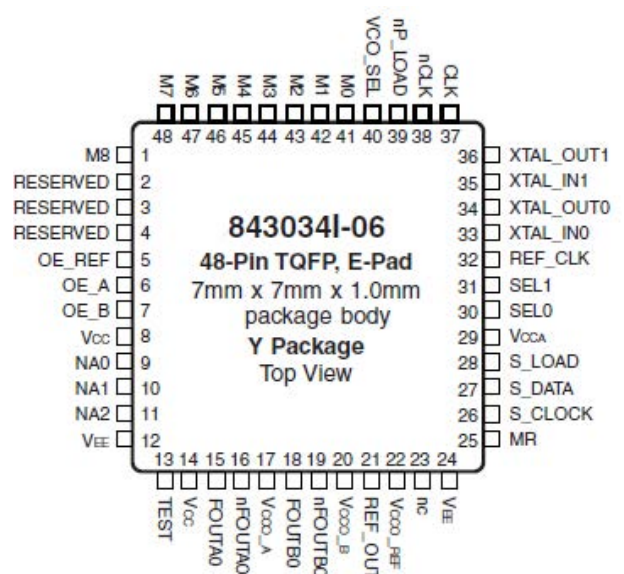

### FEATURES

- Dual differential 3.3V LVPECL outputs
- 4:1 Input Mux:
  - One differential input
  - One single-ended input
  - Two crystal oscillator interfaces
- CLK, nCLK pair can accept the following differential input levels: LVPECL, LVDS, LVHSTL, HCSL, SSTL
- Output frequency range: 120MHz to 375MHz
- Crystal input frequency range: 12MHz to 40MHz
- VCO range: 600MHz to 750MHz
- Supports Spread Spectrum Clocking (SSC)
- Parallel or serial interface for programming feedback divider and output dividers
- RMS phase jitter at 166.6MHz, using a 22.222MHz crystal (12kHz to 30MHz): 1.33ps (typical), SSC - Off
- 3.3V supply mode
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) package
- **Use functional replacement part 8t49N241-dddNLGI**

### BLOCK DIAGRAM

### PIN ASSIGNMENT

**FUNCTIONAL DESCRIPTION**

*NOTE: The functional description that follows describes operation using a 22.22MHz crystal. Valid PLL loop divider values for different crystal or input frequencies are defined in the Input Frequency Characteristics, Table 6, NOTE 1.*

The 843034I-06 features a fully integrated PLL and therefore requires no external components for setting the loop bandwidth. A fundamental crystal is used as the input to the on-chip oscillator. The output of the oscillator is fed into the phase detector. A 22.22MHz crystal provides a 22.22MHz phase detector reference frequency. The VCO of the PLL operates over a range of 600MHz to 750MHz. The output of the M divider is also applied to the phase detector.

The phase detector and the M divider force the VCO output frequency to be M times the reference frequency by adjusting the VCO control voltage. Note that for some values of M (either too high or too low), the PLL will not achieve lock. The output of the VCO is scaled by a divider prior to being sent to each of the LVPECL output buffers. The divider provides a 50% output duty cycle.

The 843034I-06 supports either serial or parallel programming modes to program the M feedback divider and N output divider. *Figure 1* shows the timing diagram for each mode. In parallel mode, the nP\_LOAD input is initially LOW. The data on the M and NA inputs are passed directly to the M divider and N output dividers. On the LOW-to-HIGH transition of the nP\_LOAD input, the data is latched and the M and N dividers remain loaded until the next LOW transition on nP\_LOAD or until a serial event occurs. As a result, the M and NA bits can be hardwired to set the M divider and NA output divider to a specific default state that

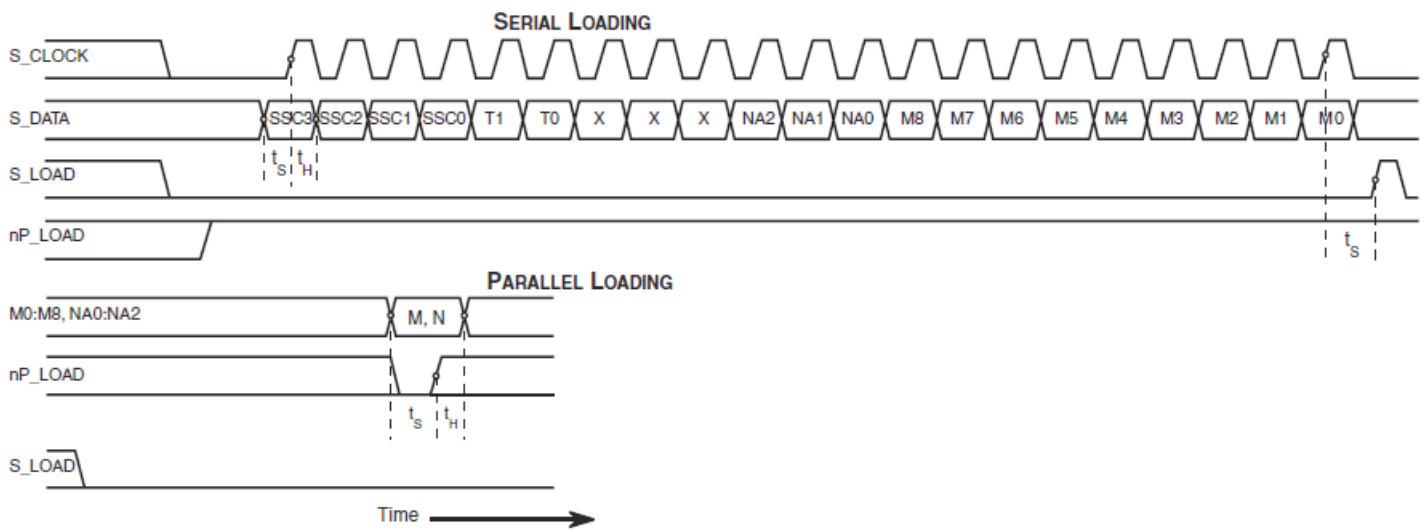

will automatically occur during power-up. The TEST output is LOW when operating in the parallel input mode. The relationship between the VCO frequency, the crystal frequency and the M divider is defined as follows: **fVCO = fxtal x M**

The M value and the required values of M0 through M8 are shown in Table 4B to program the VCO Frequency Function Table. Valid M values for which the PLL will achieve lock for a 22.22MHz reference are defined as  $26 \leq M \leq 33$ . The frequency out is defined as follows:

$$FOUT = \frac{fVCO}{N} = \frac{fxtal \times M}{N}$$

Serial operation occurs when nP\_LOAD is HIGH and S\_LOAD is LOW. The shift register is loaded by sampling the S\_DATA bits with the rising edge of S\_CLOCK. The contents of the shift register are loaded into the M divider and NA output divider when S\_LOAD transitions from LOW-to-HIGH. The M divide and NA output divide values are latched on the HIGH-to-LOW transition of S\_LOAD. If S\_LOAD is held HIGH, data at the S\_DATA input is passed directly to the M divider and NA output divider on each rising edge of S\_CLOCK. The serial mode can be used to program the M and NA bits and test bits T1 and T0. The internal registers T0 and T1 determine the state of the TEST output as follows:

T1	T0	TEST Output
0	0	LOW
0	1	S_Data, Shift Register Output
1	0	Output of M divider
1	1	Same frequency as FOUTA0

NOTE: X = Don't Care

**FIGURE 1. PARALLEL & SERIAL LOAD OPERATIONS**

TABLE 1. SSM OPERATION

SS Bit Pattern				Operation	
SS3	SS2	SS1	SS0	Mode	%
0	0	0	0	off	0
0	0	0	1	center	$\pm 0.25$
0	0	1	0	center	$\pm 0.25$
0	0	1	1	center	$\pm 0.85$
0	1	0	0	center	$\pm 0.85$
0	1	0	1	center	$\pm 1.45$
0	1	1	0	center	$\pm 1.45$
0	1	1	1	center	$\pm 1.7$
1	0	0	0	off	0
1	0	0	1	down	-0.25
1	0	1	0	down	-0.25
1	0	1	1	down	-0.75
1	1	0	0	down	-0.75
1	1	0	1	down	-1.25
1	1	1	0	down	-1.25
1	1	1	1	down	-1.5

NOTE: SS modulation frequency is approximately 32kHz using reference frequency of 22.22MHz, providing a VCO frequency of 666.66MHz.

## SPREAD SPECTRUM MODULATION

The 843034I-06 offers the option of a spread spectrum modulated output clock. The spread spectrum is controlled via 4 bits in the serial bit stream. These four bits configure the SSM to be enabled and the amount of spread modulation to be selected. See *Table 1* for the definition of the four bits. The four bits are added at the beginning of the serial data stream and are labeled SS3, SS2, SS1

and SS0. The initial state of SS3, SS2, SS1 and SS0 is 0, 0, 0, 0 which places the 843034I-06 in the mode of spread spectrum off. Additionally, a parallel load will result in spread spectrum modulation being off. The 843034I-06 offers down-spread or center-spread using triangle-wave modulation. NOTE: PLL operation not guaranteed for  $M > 31$  when using center spread.

## POWER-UP OPERATION

The 843034I-06 has internal power-up reset circuitry that initiates the phase lock loop to automatically acquire lock on power-up. On power-up the M/N values for the feedback and output dividers will be acquired from the M and N pins if nP\_Load is held Low. If nP\_Load is High during power-up, M/N values are indeterminate. The M/N values may be changed by either changing the values on the M/N pins when nP\_LOAD is low or with a serial load when nP\_LOAD is high and S\_LOAD is low.

## MR PIN OPERATION

Any time there is a change in the input frequency, either due to an external change or a change in the SEL pins, the MR pin must go high and low to relock to the new input frequency. A change in the M feedback divider by either a serial or parallel load will also cause a relock to the new input frequency.

TABLE 2. PIN DESCRIPTIONS

Number	Name	Type		Description
1, 41, 42, 43, 44, 45, 47, 48	M8, M0, M1, M2, M3, M4, M6, M7	Input	Pulldown	M divider input. Data latched on LOW-to-HIGH transition of nP_LOAD input. LVCMOS/LVTTL interface levels.
2, 3, 4	RESERVED	Reserve		Reserved pins. Do not connect.
5	OE_REF	Input	Pulldown	Output enable. Controls enabling and disabling of REF_OUT output. LVCMOS/LVTTL interface levels.
6	OE_A	Input	Pullup	Output enable. Controls enabling and disabling of FOUTA0, nFOUTA0 outputs. LVCMOS/LVTTL interface levels.
7	OE_B	Input	Pullup	Output enable. Controls enabling and disabling of FOUTB0, nFOUTB0 outputs. LVCMOS/LVTTL interface levels.
8, 14	V <sub>CC</sub>	Power		Core supply pins.
9, 10	NA0, NA1	Input	Pullup	Determines output divider value as defined in Table 4C, Function Table. LVCMOS/LVTTL interface levels.
11	NA2	Input	Pulldown	
12, 24	V <sub>EE</sub>	Power		Negative supply pins.
13	TEST	Output		Test output which is ACTIVE in the serial mode of operation. Output driven LOW in parallel mode. LVCMOS/LVTTL interface levels.
15, 16	FOUTA0, nFOU-TA0	Output		Differential output for the synthesizer. LVPECL interface levels.
17	V <sub>CCO_A</sub>	Power		Output supply pin for FOUTA0, nFOUTA0.
18, 19	FOUTB0, nFOUTB0	Output		Differential output for the synthesizer. LVPECL interface levels.
20	V <sub>CCO_B</sub>	Power		Output supply pin for FOUTB0, nFOUTB0.
21	REF_OUT	Output		Reference clock output. LVCMOS/LVTTL interface levels.
22	V <sub>CCO_REF</sub>	Power		Output supply pin for REF_OUT output.
23	nc	Unused		No connect.
25	MR	Input	Pulldown	Active High Master Reset. When logic HIGH, forces the internal PLL to a reset condition which holds the VCO at the minimum value. When logic LOW, the internal dividers and the outputs are enabled. Assertion of MR does not affect loaded M, N, S and T values. LVCMOS/LVTTL interface levels.
26	S_CLOCK	Input	Pulldown	Clocks in serial data present at S_DATA input into the shift register on the rising edge of S_CLOCK. LVCMOS/LVTTL interface levels.
27	S_DATA	Input	Pulldown	Shift register serial input. Data sampled on the rising edge of S_CLOCK. LVCMOS/LVTTL interface levels.
28	S_LOAD	Input	Pulldown	Controls transition of data from shift register into the dividers. LVCMOS/LVTTL interface levels.
29	V <sub>CCA</sub>	Power		Analog supply pin.
30, 31	SEL0, SEL1	Input	Pulldown	Clock select inputs. LVCMOS/LVTTL interface levels.
32	REF_CLK	Input	Pulldown	Reference clock input. LVCMOS/LVTTL interface levels.
33, 34	XTAL_IN0, XTAL_OUT0	Input		Crystal oscillator interface. XTAL_IN0 is the input, XTAL_OUT0 is the output.
35, 36	XTAL_IN1, XTAL_OUT1	Input		Crystal oscillator interface. XTAL_IN1 is the input, XTAL_OUT1 is the output.

Continued on next page...

TABLE 2. PIN DESCRIPTIONS, CONTINUED

Number	Name	Type		Description
37	CLK	Input	Pulldown	Non-inverting differential clock input.
38	nCLK	Input	Pullup/ Pulldown	Inverting differential clock input. $V_{cc}/2$ default when left floating.
39	nP_LOAD	Input	Pulldown	Parallel load input. Determines when data present at M8:M0 is loaded into M divider, and when data present at NA2:NA0 is loaded into the N output dividers. LVCMOS/LVTTL interface levels.
40	VCO_SEL	Input	Pullup	Determines whether synthesizer is in PLL or bypass mode. LVCMOS/LVTTL interface levels.
46	M5	Input	Pullup	M divider input. Data latched on LOW-to-HIGH transition of nP_LOAD input. LVCMOS/LVTTL interface levels.

NOTE: *Pullup* and *Pulldown* refer to internal input resistors. See Table 3, Pin Characteristics, for typical values.

## APPLICATION INFORMATION

### POWER SUPPLY FILTERING TECHNIQUES

As in any high speed analog circuitry, the power supply pins are vulnerable to random noise. To achieve optimum jitter performance, power supply isolation is required. The 843034I-06 provides separate power supplies to isolate any high switching noise from the outputs to the internal PLL.  $V_{CC}$ ,  $V_{CCA}$  and  $V_{CCO,X}$  should be individually connected to the power supply plane through vias, and  $0.01\mu\text{F}$  bypass capacitors should be used for each pin. *Figure 2* illustrates this for a generic  $V_{CC}$  pin and also shows that  $V_{CCA}$  requires that an additional  $10\Omega$  resistor along with a  $10\mu\text{F}$  bypass capacitor be connected to the  $V_{CCA}$  pin.

FIGURE 2. POWER SUPPLY FILTERING

### WIRING THE DIFFERENTIAL INPUT TO ACCEPT SINGLE ENDED LVCMOS/LVTTL LEVELS

*Figure 3* shows how the differential input can be wired to accept single ended levels. The reference voltage  $V_{REF} = V_{CC}/2$  is generated by the bias resistors  $R1$ ,  $R2$  and  $C1$ . This bias circuit should be located as close as possible to the input pin. The ratio

of  $R1$  and  $R2$  might need to be adjusted to position the  $V_{REF}$  in the center of the input voltage swing. For example, if the input clock swing is only  $2.5\text{V}$  and  $V_{CC} = 3.3\text{V}$ ,  $V_{REF}$  should be  $1.25\text{V}$  and  $R2/R1 = 0.609$ .

FIGURE 3. SINGLE ENDED SIGNAL DRIVING DIFFERENTIAL INPUT

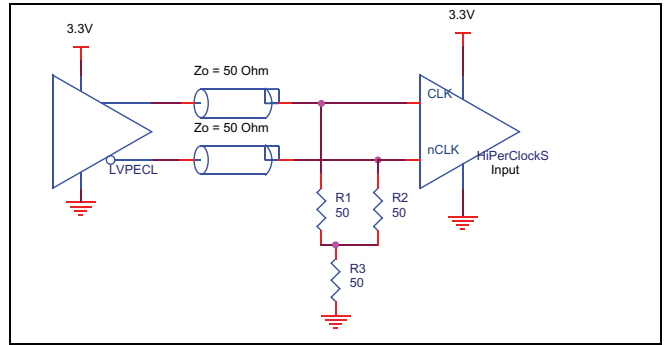

### DIFFERENTIAL CLOCK INPUT INTERFACE

The CLK/nCLK accepts LVDS, LVPECL, LVHSTL, SSTL, HCSL and other differential signals. Both  $V_{SWING}$  and  $V_{OH}$  must meet the  $V_{PP}$  and  $V_{CMR}$  input requirements. Figures 4A to 4F show interface examples for the HiPerClockS CLK/nCLK input driven by the most common driver types. The input interfaces suggested here are examples only.

Please consult with the vendor of the driver component to confirm the driver termination requirements. For example in Figure 4A, the input termination applies for IDT HiPerClockS open emitter LVHSTL drivers. If you are using an LVHSTL driver from another vendor, use their termination recommendation.

## CRYSTAL INPUT INTERFACE

The 843034I-06 has been characterized with 18pF parallel resonant crystals. The capacitor values, C1 and C2, shown in *Figure 5* below were determined using a 18pF parallel resonant crystal and were

chosen to minimize the ppm error. The optimum C1 and C2 values can be slightly adjusted for different board layouts.

FIGURE 5. CRYSTAL INPUT INTERFACE

## LVC MOS TO XTAL INTERFACE

The XTAL\_IN input can accept a single-ended LVC MOS signal through an AC coupling capacitor. A general interface diagram is shown in *Figure 6*. The XTAL\_OUT pin can be left floating. The input edge rate can be as slow as 10ns. For LVC MOS signals, it is recommended that the amplitude be reduced from full swing to half swing in order to prevent signal interference with the power rail and to reduce noise. This configuration requires that the output

impedance of the driver ( $R_o$ ) plus the series resistance ( $R_s$ ) equals the transmission line impedance. In addition, matched termination at the crystal input will attenuate the signal in half. This can be done in one of two ways. First, R1 and R2 in parallel should equal the transmission line impedance. For most 50Ω applications, R1 and R2 can be 100Ω. This can also be accomplished by removing R1 and making R2 50Ω.

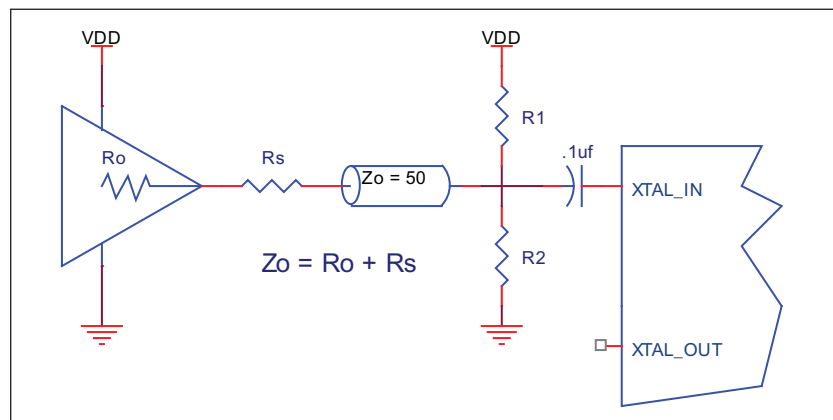

FIGURE 6. GENERAL DIAGRAM FOR LVC MOS DRIVER TO XTAL INPUT INTERFACE

## RECOMMENDATIONS FOR UNUSED INPUT AND OUTPUT PINS

### INPUTS:

#### CRYSTAL INPUTS

For applications not requiring the use of the crystal oscillator input, both XTAL\_IN and XTAL\_OUT can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from XTAL\_IN to ground.

#### CLK/nCLK INPUTS

For applications not requiring the use of the differential input, both CLK and nCLK can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from CLK to ground.

#### REF\_CLK INPUT

For applications not requiring the use of the reference clock, it can be left floating. Though not required, but for additional protection, a 1kΩ resistor can be tied from the REF\_CLK to ground.

#### LVC MOS CONTROL PINS

All control pins have internal pullups or pulldowns; additional resistance is not required but can be added for additional protection. A 1kΩ resistor can be used.

### OUTPUTS:

#### LVC MOS OUTPUTS

All unused LVC MOS output can be left floating. We recommend that there is no trace attached.

#### LVPECL OUTPUTS

All unused LVPECL outputs can be left floating. We recommend that there is no trace attached. Both sides of the differential output pair should either be left floating or terminated.

## TERMINATION FOR 3.3V LVPECL OUTPUTS

The clock layout topology shown below is a typical termination for LVPECL outputs. The two different layouts mentioned are recommended only as guidelines.

The differential outputs are low impedance follower outputs that generate ECL/LVPECL compatible outputs. Therefore, terminating resistors (DC current path to ground) or current sources must be used for functionality. These outputs are designed to drive 50Ω

transmission lines. Matched impedance techniques should be used to maximize operating frequency and minimize signal distortion. *Figures 7A and 7B* show two different layouts which are recommended only as guidelines. Other suitable clock layouts may exist and it would be recommended that the board designers simulate to guarantee compatibility across all printed circuit and clock component process variations.

FIGURE 7A. LVPECL OUTPUT TERMINATION

FIGURE 7B. LVPECL OUTPUT TERMINATION

## EPAD THERMAL RELEASE PATH

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 8*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application

specific and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, refer to the Application Note on the *Surface Mount Assembly* of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

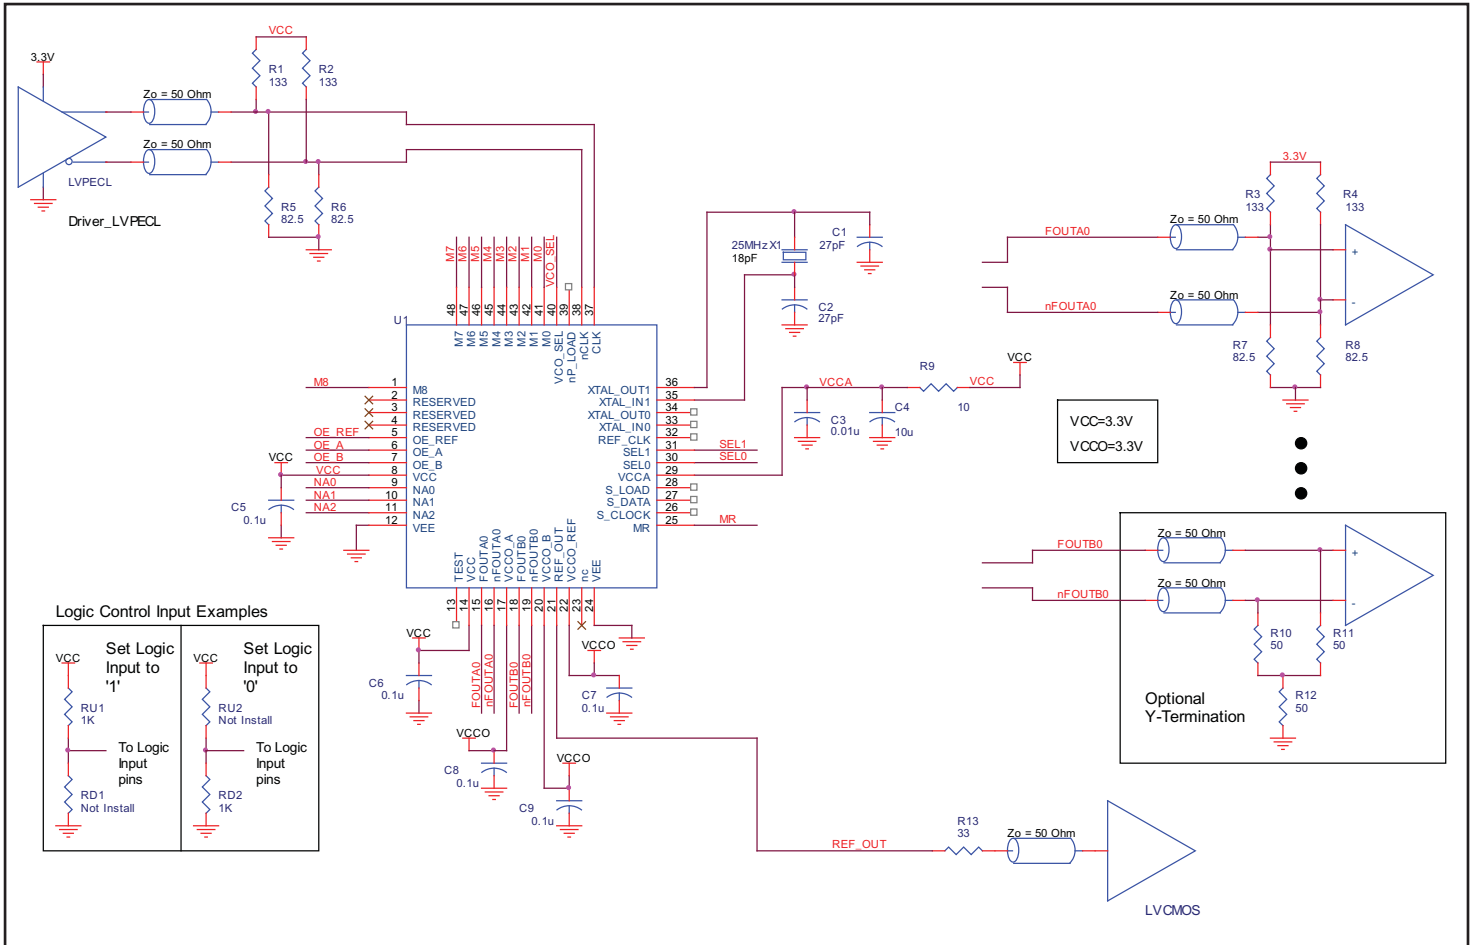

**FIGURE 8. ASSEMBLY FOR EXPOSED PAD THERMAL RELEASE PATH –SIDE VIEW (DRAWING NOT TO SCALE)**

**APPLICATION SCHEMATIC EXAMPLE**

Figure 9 shows an example of 843034I-06 application schematic. In this example, the device is operated at  $V_{CC} = V_{CCO} = 3.3V$ . The device are be driven by a crystal, LVC MOS or LVPECL input sources. The 18pF parallel resonant 25MHz crystal is used. The  $C1 = 27pF$  and  $C2 = 27pF$  are recommended for frequency accuracy. For different board

layout, the  $C1$  and  $C2$  may be slightly adjusted for optimizing frequency accuracy. For the LVPECL output drivers, only two termination examples are shown in this schematic. Additional termination approaches are shown in the LVPECL Termination Application Note.

**FIGURE 9. 843034I-06 APPLICATION SCHEMATIC EXAMPLE**

## POWER CONSIDERATIONS

This section provides information on power dissipation and junction temperature for the 843034I-06. Equations and example calculations are also provided.

### 1. Power Dissipation.

The total power dissipation for the 843034I-06 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for  $V_{CC} = 3.3V + 5\% = 3.465V$ , which gives worst case results.

**NOTE:** Please refer to Section 3 for details on calculating power dissipated in the load.

### Core and LVPECL Output Power Dissipation

- Power (core)<sub>MAX</sub> =  $V_{CC\_MAX} * I_{EE\_MAX} = 3.465V * 176mA = 609.84mW$
- Power (outputs)<sub>MAX</sub> = **30mW/Loaded Output pair**  
If all outputs are loaded, the total power is  $2 * 30mW = 60mW$

### LVC MOS Output Power Dissipation

- Output Impedance  $R_{OUT}$  Power Dissipation due to Loading  $50\Omega$  to  $V_{CCO\_REF}/2$   
Output Current  $I_{OUT} = V_{CCO\_MAX} / [2 * (50\Omega + R_{OUT})] = 3.465V / [2 * (50\Omega + 7\Omega)] = 30.4mA$
- Power Dissipation on the  $R_{OUT}$  per LVC MOS output  
Power ( $R_{OUT}$ ) =  $R_{OUT} * (I_{OUT})^2 = 7\Omega * (30.4mA)^2 = 6.97mW$  per output

### Total Power Dissipation

- **Total Power**  
= Power (LVPECL) + Power ( $R_{OUT}$ )  
=  $609.84mW + 60mW + 6.47mW$   
= **676.31mW**

## 2. Junction Temperature.

Junction temperature,  $T_j$ , is the temperature at the junction of the bond wire and bond pad and directly affects the reliability of the device. The maximum recommended junction temperature for HiPerClockS™ devices is 125°C.

The equation for  $T_j$  is as follows:  $T_j = \theta_{JA} * Pd\_total + T_A$

$T_j$  = Junction Temperature

$\theta_{JA}$  = Junction-to-Ambient Thermal Resistance

$Pd\_total$  = Total Device Power Dissipation (example calculation is in section 1 above)

$T_A$  = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance  $\theta_{JA}$  must be used. Assuming no air flow and a multi-layer board, the appropriate value is 29°C/W per Table 9 below.

Therefore,  $T_j$  for an ambient temperature of 85°C with all outputs switching is:  
 $85^\circ\text{C} + 0.676\text{W} * 29^\circ\text{C}/\text{W} = 104.6^\circ\text{C}$ . This is below the limit of 125°C.

This calculation is only an example.  $T_j$  will obviously vary depending on the number of loaded outputs, supply voltage, air flow, and the type of board (single layer or multi-layer).

**TABLE 9. THERMAL RESISTANCE  $\theta_{JA}$  FOR 48-LEAD TQFP, E-PAD FORCED CONVECTION**

$\theta_{JA}$ by Velocity (Meters per Second)			
	0	1	2.5
Multi-Layer PCB, JEDEC Standard Test Boards	29°C/W	22.6°C/W	21.1°C/W

### 3. Calculations and Equations.

The purpose of this section is to derive the power dissipated into the load.

LVPECL output driver circuit and termination are shown in *Figure 10*.

**FIGURE 10. LVPECL DRIVER CIRCUIT AND TERMINATION**

To calculate worst case power dissipation into the load, use the following equations which assume a 50Ω load, and a termination voltage of  $V_{CCO} - 2V$ .

- For logic high,  $V_{OUT} = V_{OH\_MAX} = V_{CCO\_MAX} - 0.9V$

$$(V_{CCO\_MAX} - V_{OH\_MAX}) = 0.9V$$

- For logic low,  $V_{OUT} = V_{OL\_MAX} = V_{CCO\_MAX} - 1.7V$

$$(V_{CCO\_MAX} - V_{OL\_MAX}) = 1.7V$$

Pd\_H is power dissipation when the output drives high.

Pd\_L is the power dissipation when the output drives low.

$$\begin{aligned} Pd\_H &= [(V_{OH\_MAX} - (V_{CCO\_MAX} - 2V))/R_L] * (V_{CCO\_MAX} - V_{OH\_MAX}) = [(2V - (V_{CCO\_MAX} - V_{OH\_MAX}))/R_L] * (V_{CCO\_MAX} - V_{OH\_MAX}) = \\ &= [(2V - 0.9V)/50\Omega] * 0.9V = \mathbf{19.8mW} \end{aligned}$$

$$\begin{aligned} Pd\_L &= [(V_{OL\_MAX} - (V_{CCO\_MAX} - 2V))/R_L] * (V_{CCO\_MAX} - V_{OL\_MAX}) = [(2V - (V_{CCO\_MAX} - V_{OL\_MAX}))/R_L] * (V_{CCO\_MAX} - V_{OL\_MAX}) = \\ &= [(2V - 1.7V)/50\Omega] * 1.7V = \mathbf{10.2mW} \end{aligned}$$

Total Power Dissipation per output pair = Pd\_H + Pd\_L = **30mW**
