

### Notes

By Rakesh Bhatia

## Introduction

The RC32438 device is a high performance, general-purpose, integrated processor that incorporates a 32-bit CPU core with a number of peripherals including:

- A memory controller supporting double data rate SDRAM
- A separate memory/peripheral controller interfacing to EPROM, flash and I/O peripherals
- Two Ethernet MACs
- A 32-bit v.2.2 compatible PCI interface
- Other generic modules, such as two serial ports, I<sup>2</sup>C, SPI, interrupt controller, GPIO, and DMA.

The purpose of this document is to show the hardware interface between the RC32438 device and a CompactFlash storage card using the general memory and peripheral bus provided on the RC32438.

## CompactFlash Modes

CompactFlash (CF) storage cards are required to support 3 modes of operation:

- PC Card memory interface mode
- PC Card I/O interface mode
- True IDE mode.

CF+ cards are not required to support the True IDE mode but may optionally do so. The task file registers provide the necessary registers for control and status information. One of the main differences between these modes is the way in which task file registers are mapped. For example, in the PC card memory interface mode, task file registers are mapped into common memory space. In the I/O interface mode and in the True IDE mode, these registers are mapped into the I/O address space. There are 8 registers in the Task File, and these are accessed by the address lines A0:A2, as described later in this document. The True IDE mode, described in this document, is the simplest to use with the RC32438 device.

## True IDE Mode

A CF card is configured in True IDE mode only when the -OE input signal is grounded by the host during power-up. In this mode, the PCMCIA protocol and configuration are disabled and only I/O operations to the Task File and Data Register are allowed. In other words, no Memory or Attribute Registers are accessible to the host. The advantage of using True IDE mode is that it can be interfaced with a general bus on a system without using glue logic. Compared to the other two modes of operation, the True IDE mode requires only CE1 to be asserted to perform a read or write operation. In the PC card memory or I/O modes, both CE1 and CE2 need to be asserted at the same time, which requires external logic gates.

## RC32438 Memory and Peripheral Device Controller

The RC32438 device provides demultiplexed address and data bus and 6 chip selects. Flexible protocol configuration parameters include programmable wait states and post transaction delays. The various bus signals provided by the microprocessor are listed below:

MADDR[25:0] (address bus, MADDR[21:0] directly available as I/O pins, MADDR[25:22] are GPIO alternate functions)

MDATA[15:0] (data bus)

## Notes

- OEN (output enable, may be used as Intel style read signal)
- BWEN[1:0] (byte write enables, may be used as Intel style write signals)
- RWN (Motorola style read/write signal)
- CSN [5:0] (chip selects)
- WAITACKN (configurable as Intel style wait signal or Motorola style transfer acknowledge signal)
- BOEN (external data bus buffer output enable)
- BDIRN (external data bus buffer direction).

Using some of these signals, a CF card can be connected to the memory and peripheral bus of the RC32438 device, as shown in the next section.

## Hardware Interface

Figure 1 shows the hardware interface between a CF card and the RC32438 device. As shown in the figure, the interface requires minimum external logic. Unused signals in the True IDE mode and unused status signals are not shown. For clarity, power signals are also not shown.

Figure 1 Example of CF Storage Card Interface to RC32438

## Notes

**Signal Description**

The features of various signals are described below:

**D0:D15**

In True IDE mode, all Task File operations are in byte mode on the low order bus and all data transfers use the 16-bit bus. The data bus D0:D15 provides a bi-directional path between the CF card and the micro-processor.

**A0:A2**

These signals are used to select one of the eight registers in the Task File.

**CS1:CS2**

Chip selects are inputs to the CF card and are used to select either the Task File registers or Alternate Status register and device control register.

**ATA SEL**

In order to ensure that the CF card is configured in True IDE mode, the host at power-up should ground the ATA SEL input pin to the CF card.

**IORD**

The OEN signal of the RC32438 is asserted when data should be driven on by an external device on the memory and peripheral bus. This serves as a strobe to the IORD pin of the CF card, as specified in the True IDE mode spec.

**CSEL**

This signal is used to configure a CF card as a Master or slave when multiple cards are being used in the system. In the above example, only one CF card is being used, therefore the CSEL is shown as grounded.

**IOWR**

The IOWR/ signal serves as a strobe to pulse used to clock I/O data on the CF card's data bus into the storage card. The BWENx signals of the RC32438 provide this pulse as byte write enables.

**Reset**

The RSTN signal of the RC32438 is asserted during a warm reset, thereby resetting the CF card.

**Inpack, WE and Reg**

These signals are not used in the True IDE mode.

**Signals Not Used**

The following CF card pins are not used or not connected in the example shown in Figure 1.

PCDIAG: not used

DASP: not used

INTRO: not used

IORDY: not used

IOIS16: not used

Note that CD1 and CD2 should be connected to ground on the CF card.

## Notes

### Timing

The interface shown in Figure 1 above will meet the timing requirements for the read and write transactions shown in the CompactFlash Card spec "CF+ and CompactFlash specification Revision 1.4". The RC32438 device offers several programmable timing parameters for read and write transactions occurring over its Memory and Peripheral bus. Depending upon the CompactFlash card used, it is recommended that the timings be verified and these parameters be programmed as required.

For read transactions, the programmable parameters are CSD, OED, RWS, PRD, and CSH. For write transactions, the programmable parameters include CSD, BWD, WW, PWD, CSH, and WDH. Using these programmable parameters provides for flexibility in choosing a CF card. Detailed descriptions and waveforms showing these parameters are shown in Chapter 6, Device Controller, of the RC32438 User Reference Manual. To provide a better view of the programmable parameters, an example of a read transaction is shown in Figure 2.

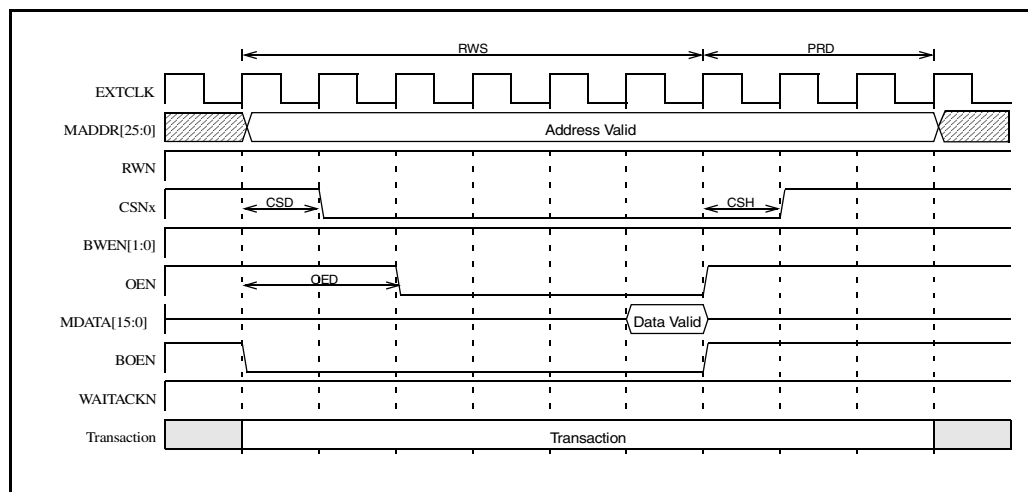

Figure 2 Generic Device Read Transaction

### Conclusion

The memory and peripheral bus of the RC32438 device provides a simple-to-use and inexpensive method of interfacing to CompactFlash cards as described in this document. The actual logic or timing has not been verified in a lab environment.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
  2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
  3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
  4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
  5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
    - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
    - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
  6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
  7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
  8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
  9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
  10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
  11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
  12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.
- (Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.
- (Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
