

### Description

The 5V2305S is a low skew, single input to five output, clock buffer. The 5V2305S has best in class additive phase Jitter of sub 50 fsec.

The 5V2305S also supports a synchronous glitch-free Output Enable function to eliminate any potential intermediate incorrect output clock cycles when enabling or disabling outputs. It comes in various packages and can operate from a 1.8V to 3.3V supply.

### Features

- Extremely low RMS Additive Phase Jitter: 50fs
- Low output skew: 20ps
- Packaged in 16-pin TSSOP and small 2mm x 2mm 10-pin DFN
- Pb (lead) free package
- Low power CMOS technology
- Operating voltages of 1.8V to 3.3V
- Extended temperature range (-40°C to +105°C)

## Pin Assignments

16-pin (173 mil) TSSOP

10-pin DFN (2x2mm)

## Pin Descriptions

Pin Name	Pin Number		Pin Type	Pin Description
	16-pin TSSOP	10-pin DFN		
VDD	2, 7, 10, 14, 15	5	Power	DC power supply. Connect to 1.8V to 3.3V.
GND	1, 4, 8, 12	1, 6	Power	Power supply ground.
ICLK	16	10	Input	Reference input clock.
Q0	3	2	Output	Clock Output 0. Same frequency as CLKIN.
Q1	5	3	Output	Clock Output 1. Same frequency as CLKIN.
Q2	6	4	Output	Clock Output 2. Same frequency as CLKIN.
Q3	11	8	Output	Clock Output 3. Same frequency as CLKIN.
Q4	13	9	Output	Clock Output 4. Same frequency as CLKIN.
OE	9	7	Input	Active High Output Enable pin. When this pin is high, all outputs are enabled and active. When this pin is low, all outputs are driven low.

## External Components

A minimum number of external components are required for proper operation. A decoupling capacitor of 0.01 $\mu$ F should be connected between VDD on pin 2 and GND on pin 4, as close to the device as possible. A 33 $\Omega$  series terminating resistor may be used on each clock output if the trace is longer than 1 inch.

To achieve the low output skew that the 5V2305S is capable of, careful attention must be paid to board layout. Essentially, all five outputs must have identical terminations, identical loads and identical trace geometries. If they do not, the output skew will be degraded. For example, using a 30 $\Omega$  series termination on one output (with 33 $\Omega$  on the others) will cause at least 15 ps of skew.

## Absolute Maximum Ratings

Stresses above the ratings listed below can cause permanent damage to the 5V2305S. These ratings, which are standard values for IDT commercially rated parts, are stress ratings only. Functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods can affect product reliability. Electrical parameters are guaranteed only over the recommended operating temperature range.

Item	Rating
Supply Voltage, VDD	3.465V
