

### Features

- ◆ True Dual-Ported memory cells which allow simultaneous access of the same memory location
- ◆ High-speed access
  - Commercial: 15/25/35/55ns (max.)
  - Industrial: 20ns (max.)
- ◆ Low-power operation
  - IDT7027S
    - Active: 750mW (typ.)
    - Standby: 5mW (typ.)
  - IDT7027L
    - Active: 750mW (typ.)
    - Standby: 1mW (typ.)
- ◆ Separate upper-byte and lower-byte control for bus matching capability.
- ◆ Dual chip enables allow for depth expansion without external logic
- ◆ IDT7027 easily expands data bus width to 32 bits or more using the Master/Slave select when cascading more than one device
- ◆  $M/\bar{S} = V_{IH}$  for  $\overline{BUSY}$  output flag on Master,  $M/\bar{S} = V_{IL}$  for  $\overline{BUSY}$  input on Slave
- ◆ Busy and Interrupt Flags
- ◆ On-chip port arbitration logic
- ◆ Full on-chip hardware support of semaphore signaling between ports
- ◆ Fully asynchronous operation from either port
- ◆ TTL-compatible, single 5V ( $\pm 10\%$ ) power supply
- ◆ Available in 100-pin Thin Quad Flatpack (TQFP) and 108-pin Ceramic Pin Grid Array (PGA)
- ◆ Industrial temperature range ( $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ ) is available for selected speeds
- ◆ Green parts available, see ordering information

### Functional Block Diagram

**NOTES:**

1.  $\overline{BUSY}$  is an input as a Slave ( $M/\bar{S} = V_{IL}$ ) and an output as a Master ( $M/\bar{S} = V_{IH}$ ).
2.  $\overline{BUSY}$  and  $\overline{INT}$  are non-tri-state totem-pole outputs (push-pull).

3199 drw 01

### Description

The IDT7027 is a high-speed 32K x 16 Dual-Port Static RAM, designed to be used as a stand-alone 512K-bit Dual-Port RAM or as a combination MASTER/SLAVE Dual-Port RAM for 32-bit-or-more word systems. Using the IDT MASTER/SLAVE Dual-Port RAM approach in 32-bit or wider memory system applications results in full-speed, error-free operation without the need for additional discrete logic.

The device provides two independent ports with separate control,

address, and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. An automatic power down feature controlled by the chip enables (CE<sub>0</sub> and CE<sub>1</sub>) permits the on-chip circuitry of each port to enter a very low standby power mode.

Fabricated using CMOS high-performance technology, these devices typically operate on only 750mW of power. The IDT7027 is packaged in a 100-pin Thin Quad Flatpack (TQFP) and a 108-pin ceramic Pin Grid Array (PGA).

### Pin Configurations<sup>(1,2,3)</sup>

**NOTES:**

1. All Vcc pins must be connected to power supply.
2. All GND pins must be connected to ground supply.
3. Package body is approximately 14mm x 14mm x 1.4mm.
4. This package code is used to reference the package diagram.

Pin Configurations<sup>(1,2,3)</sup> (con't.)

3199 drw 03

NOTES:

1. All Vcc pins must be connected to power supply.
2. All GND pins must be connected to ground supply.
3. Package body is approximately 1.21 in x 1.21 in x .16 in.
4. This package code is used to reference the package diagram.
5. This text does not indicate orientation of the actual part-marking.

Pin Names

Left Port	Right Port	Names
$\overline{CE}_{0L}$ , CE1L	$\overline{CE}_{0R}$ , CE1R	Chip Enables
R $\overline{W}_{L}$	R $\overline{W}_{R}$	Read/Write Enable
$\overline{OE}_{L}$	$\overline{OE}_{R}$	Output Enable
A0L - A14L	A0R - A14R	Address
I/O0L - I/O15L	I/O0R - I/O15R	Data Input/Output
$\overline{SEM}_{L}$	$\overline{SEM}_{R}$	Semaphore Enable
$\overline{UB}_{L}$	$\overline{UB}_{R}$	Upper Byte Select
$\overline{LB}_{L}$	$\overline{LB}_{R}$	Lower Byte Select
$\overline{INT}_{L}$	$\overline{INT}_{R}$	Interrupt Flag
$\overline{BUSY}_{L}$	$\overline{BUSY}_{R}$	Busy Flag
	M/S	Master or Slave Select
	Vcc	Power
	GND	Ground

3199 tbl 01

Truth Table I – Chip Enable

$\overline{CE}$	$\overline{CE}_0$	$CE_1$	Mode
L	$V_{IL}$	$V_{IH}$	Port Selected (TTL Active)
	$\leq 0.2V$	$\geq V_{CC} - 0.2V$	Port Selected (CMOS Active)
H	$V_{IH}$	X	Port Deselected (TTL Inactive)
	X	$V_{IL}$	Port Deselected (TTL Inactive)
	$\geq V_{CC} - 0.2V$	X	Port Deselected (CMOS Inactive)
	X	$\leq 0.2V$	Port Deselected (CMOS Inactive)

3199 tbl 02

NOTES:

1. Chip Enable references are shown above with the actual  $\overline{CE}_0$  and  $CE_1$  levels,  $\overline{CE}$  is a reference only.
2. Port "A" and "B" references are located where  $\overline{CE}$  is used.
3. "H" =  $V_{IH}$  and "L" =  $V_{IL}$ .

Truth Table II – Non-Contention Read/Write Control

Inputs <sup>(1)</sup>						Outputs		Mode
$\overline{CE}^{(2)}$	$R/\overline{W}$	$\overline{OE}$	$\overline{UB}$	$\overline{LB}$	$\overline{SEM}$	I/O <sub>8-15</sub>	I/O <sub>0-7</sub>	
H	X	X	X	X	H	High-Z	High-Z	Deselected: Power-Down
X	X	X	H	H	H	High-Z	High-Z	Both Bytes Deselected
L	L	X	L	H	H	DATA <sub>IN</sub>	High-Z	Write to Upper Byte Only
L	L	X	H	L	H	High-Z	DATA <sub>IN</sub>	Write to Lower Byte Only
L	L	X	L	L	H	DATA <sub>IN</sub>	DATA <sub>IN</sub>	Write to Both Bytes
L	H	L	L	H	H	DATA <sub>OUT</sub>	High-Z	Read Upper Byte Only
L	H	L	H	L	H	High-Z	DATA <sub>OUT</sub>	Read Lower Byte Only
L	H	L	L	L	H	DATA <sub>OUT</sub>	DATA <sub>OUT</sub>	Read Both Bytes
X	X	H	X	X	X	High-Z	High-Z	Outputs Disabled

3199 tbl 03

NOTES:

1. A<sub>0L</sub> – A<sub>14L</sub> ≠ A<sub>0R</sub> – A<sub>14R</sub>.
2. Refer to Chip Enable Truth Table.

Truth Table III – Semaphore Read/Write Control

Inputs <sup>(1)</sup>						Outputs		Mode
$\overline{CE}^{(2)}$	$R/\overline{W}$	$\overline{OE}$	$\overline{UB}$	$\overline{LB}$	$\overline{SEM}$	I/O <sub>8-15</sub>	I/O <sub>0-7</sub>	
H	H	L	X	X	L	DATA <sub>OUT</sub>	DATA <sub>OUT</sub>	Read Data in Semaphore Flag
X	H	L	H	H	L	DATA <sub>OUT</sub>	DATA <sub>OUT</sub>	Read Data in Semaphore Flag
H	↑	X	X	X	L	DATA <sub>IN</sub>	DATA <sub>IN</sub>	Write I/O <sub>0</sub> into Semaphore Flag
X	↑	X	H	H	L	DATA <sub>IN</sub>	DATA <sub>IN</sub>	Write I/O <sub>0</sub> into Semaphore Flag
L	X	X	L	X	L	—	—	Not Allowed
L	X	X	X	L	L	—	—	Not Allowed

3199 tbl 04

NOTES:

1. There are eight semaphore flags written to via I/O<sub>0</sub> and read from all the I/Os (I/O<sub>0</sub>–I/O<sub>15</sub>). These eight semaphore flags are addressed by A<sub>0</sub>–A<sub>2</sub>.
2. Refer to Chip Enable Truth Table.

### Absolute Maximum Ratings<sup>(1,3)</sup>

Symbol	Rating	Commercial & Industrial	Unit
V <sub>TERM</sub> <sup>(2)</sup>	Terminal Voltage with Respect to GND	-0.5 to +7.0	V
T <sub>BIAS</sub>	Temperature Under Bias	-55 to +125	°C
T <sub>STG</sub>	Storage Temperature	-65 to +150	°C
I <sub>OUT</sub>	DC Output Current	50	mA

**NOTES:**

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V<sub>TERM</sub> must not exceed V<sub>CC</sub> + 10% for more than 25% of the cycle time or 10ns maximum, and is limited to ≤ 20mA for the period of V<sub>TERM</sub> ≥ V<sub>CC</sub> + 10%.

3199 tbl 05

### Maximum Operating Temperature and Supply Voltage<sup>(1)</sup>

Grade	Ambient Temperature	GND	V <sub>CC</sub>
Commercial	0°C to +70°C	0V	5.0V ± 10%
Industrial	-40°C to +85°C	0V	5.0V ± 10%

**NOTE:**

- This is the parameter T<sub>A</sub>. This is the "instant on" case temperature.

3199 tbl 06

### Capacitance<sup>(1)</sup>

(T<sub>A</sub> = +25°C, f = 1.0mhz) TQFP ONLY

Symbol	Parameter	Conditions	Max.	Unit
C <sub>IN</sub>	Input Capacitance	V <sub>IN</sub> = 0V	9	pF
C <sub>OUT</sub> <sup>(2)</sup>	Output Capacitance	V <sub>OUT</sub> = 0V	10	pF

**NOTES:**

- This parameter is determined by device characterization but is not production tested.
- C<sub>OUT</sub> also references C<sub>I/O</sub>.

3199 tbl 08

### Recommended DC Operating Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
V <sub>CC</sub>	Supply Voltage	4.5	5.0	5.5	V
GND	Ground	0	0	0	V
V <sub>IH</sub>	Input High Voltage	2.2	—	6.0 <sup>(2)</sup>	V
V <sub>IL</sub>	Input Low Voltage	-0.5 <sup>(1)</sup>	—	0.8	V

**NOTES:**

- V<sub>IL</sub> ≥ -1.5V for pulse width less than 10ns.
- V<sub>TERM</sub> must not exceed V<sub>CC</sub> + 10%.

3199 tbl 07

### DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range (V<sub>CC</sub> = 5.0V ± 10%)

Symbol	Parameter	Test Conditions	7027S		7027L		Unit
			Min.	Max.	Min.	Max.	
I <sub>L</sub>	Input Leakage Current <sup>(1)</sup>	V <sub>CC</sub> = 5.5V, V <sub>IN</sub> = 0V to V <sub>CC</sub>	—	10	—	5	μA
I <sub>O</sub>	Output Leakage Current	$\overline{CE}$ = V <sub>IH</sub> , V <sub>OUT</sub> = 0V to V <sub>CC</sub>	—	10	—	5	μA
V <sub>OL</sub>	Output Low Voltage	I <sub>OL</sub> = 4mA	—	0.4	—	0.4	V
V <sub>OH</sub>	Output High Voltage	I <sub>OH</sub> = -4mA	2.4	—	2.4	—	V

**NOTE:**

- At V<sub>CC</sub> ≤ 2.0V, input leakages are undefined.

3199 tbl 09

3199 tbl 10b

NOTES:

- 'X' in part numbers indicates power rating (S or L).
- V<sub>CC</sub> = 5V, T<sub>A</sub> = +25°C, and are not production tested. I<sub>CCDC</sub> = 120mA (Typ.)
- At f = f<sub>MAX</sub>, address and control lines (except Output Enable) are cycling at the maximum frequency read cycle of 1/ t<sub>rc</sub>, and using "AC Test Conditions" of input levels of GND to 3V.
- f = 0 means no address or control lines change.
- Port "A" may be either left or right port. Port "B" is the opposite from port "A".
- Refer to Chip Enable Truth Table.

NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization, but is not production tested.
3. To access RAM, CE = VIL and SEM = VIH. To access semaphore, CE = VIH and SEM = VIL.
4. 'X' in part numbers indicates power rating (S or L).
5. Refer to Chip Enable Truth Table.

Waveform of Read Cycles<sup>(5)</sup>

3199 drw 05

Timing of Power-Up Power-Down

3199 drw 06

NOTES:

1. Timing depends on which signal is asserted last,  $\overline{CE}$ ,  $\overline{OE}$ ,  $\overline{LB}$ , or  $\overline{UB}$ .
2. Timing depends on which signal is de-asserted first  $\overline{CE}$ ,  $\overline{OE}$ ,  $\overline{LB}$ , or  $\overline{UB}$ .
3.  $t_{BDD}$  delay is required only in cases where the opposite port is completing a write operation to the same address location. For simultaneous read operations  $\overline{BUSY}$  has no relation to valid output data.
4. Start of valid data depends on which timing becomes effective last  $t_{AOE}$ ,  $t_{ACE}$ ,  $t_{AA}$  or  $t_{BDD}$ .
5.  $\overline{SEM} = V_{IH}$ .
6. Refer to Chip Enable Truth Table.

3199 tbl 13

**NOTES:**

1. Transition is measured 0mV from Low or High-impedance voltage with Output Test Load (Figure 2).
2. This parameter is guaranteed by device characterization, but is not production tested.
3. To access RAM  $\overline{CE} = V_{IL}$  and  $\overline{SEM} = V_{IH}$ . To access semaphore,  $\overline{CE} = V_{IH}$  and  $\overline{SEM} = V_{IL}$ . Either condition must be valid for the entire t<sub>EW</sub> time. Refer to Chip Enable Truth Table.
4. The specification for t<sub>DH</sub> must be met by the device supplying write data to the RAM under all operating conditions. Although t<sub>DH</sub> and t<sub>OW</sub> values will vary over voltage and temperature, the actual t<sub>DH</sub> will always be smaller than the actual t<sub>OW</sub>.
5. 'X' in part numbers indicates power rating (S or L).

Timing Waveform of Write Cycle No. 1,  $R/\overline{W}$  Controlled Timing<sup>(1,5,8)</sup>

3199 drw 07

Timing Waveform of Write Cycle No. 2,  $\overline{CE}$ ,  $\overline{UB}$ ,  $\overline{LB}$  Controlled Timing<sup>(1,5)</sup>

3199 drw 08

NOTES:

1.  $R/\overline{W}$  or  $\overline{CE}$  or  $\overline{UB}$  and  $\overline{LB} = V_{IH}$  during all address transitions.
2. A write occurs during the overlap ( $t_{EW}$  or  $t_{WP}$ ) of a  $\overline{CE} = V_{IL}$  and a  $R/\overline{W} = V_{IL}$  for memory array writing cycle.
3.  $t_{WR}$  is measured from the earlier of  $\overline{CE}$  or  $R/\overline{W}$  (or  $\overline{SEM}$  or  $R/\overline{W}$ ) going HIGH to the end of write cycle.
4. During this period, the I/O pins are in the output state and input signals must not be applied.
5. If the  $\overline{CE}$  or  $\overline{SEM} = V_{IL}$  transition occurs simultaneously with or after the  $R/\overline{W} = V_{IL}$  transition, the outputs remain in the High-impedance state.
6. Timing depends on which enable signal is asserted last,  $\overline{CE}$  or  $R/\overline{W}$ .
7. This parameter is guaranteed by device characterization, but is not production tested. Transition is measured 0mV from steady state with the Output Test Load (Figure 2).
8. If  $\overline{OE} = V_{IL}$  during  $R/\overline{W}$  controlled write cycle, the write pulse width must be the larger of  $t_{WP}$  or ( $t_{WZ} + t_{DW}$ ) to allow the I/O drivers to turn off and data to be placed on the bus for the required  $t_{DW}$ . If  $\overline{OE} = V_{IH}$  during an  $R/\overline{W}$  controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified  $t_{WP}$ .
9. To access RAM,  $\overline{CE} = V_{IL}$  and  $\overline{SEM} = V_{IH}$ . To access semaphore,  $\overline{CE} = V_{IH}$  and  $\overline{SEM} = V_{IL}$ .  $t_{EW}$  must be met for either condition.
10. Refer to Chip Enable Truth Table.

Timing Waveform of Semaphore Read after Write Timing, Either Side<sup>(1)</sup>

Right Port Writes "1" to Semaphore	1	1	Semaphore free
Left Port Writes "0" to Semaphore	0	1	Left port has semaphore token
Left Port Writes "1" to Semaphore	1	1	Semaphore free

3199 tbl 18

NOTES:

1. This table denotes a sequence of events for only one of the eight semaphores on the IDT7027.
2. There are eight semaphore flags written to via I/O0 and read from all the I/O's (I/O0-I/O15). These eight semaphores are addressed by A0-A2.
3.  $\overline{CE} = V_{IH}$ ,  $\overline{SEM} = V_{IL}$ , to access the semaphores. Refer to the Semaphore Read/Write Control Truth Table.

Functional Description

The IDT7027 provides two ports with separate control, address and I/O pins that permit independent access for reads or writes to any location in memory. The IDT7027 has an automatic power down feature controlled by  $\overline{CE}_0$  and  $\overline{CE}_1$ . The  $\overline{CE}_0$  and  $\overline{CE}_1$  control the on-chip power down circuitry that permits the respective port to go into a standby mode when not selected ( $\overline{CE} = V_{IH}$ ). When a port is enabled, access to the entire memory array is permitted.

Interrupts

If the user chooses the interrupt function, a memory location (mail box or message center) is assigned to each port. The left port interrupt flag

( $\overline{INT}_L$ ) is asserted when the right port writes to memory location 7FFE (HEX), where a write is defined as  $\overline{CE}_R = R/\overline{W}_R = V_{IL}$  per Truth Table IV. The left port clears the interrupt through access of address location 7FFE when  $\overline{CE}_L = \overline{OE}_L = V_{IL}$ ,  $R/\overline{W}$  is a "don't care". Likewise, the right port interrupt flag ( $\overline{INT}_R$ ) is asserted when the left port writes to memory location 7FFF (HEX) and to clear the interrupt flag ( $\overline{INT}_R$ ), the right port must read the memory location 7FFF. The message (16 bits) at 7FFE or 7FFF is user-defined since it is an addressable SRAM location. If the interrupt function is not used, address locations 7FFE and 7FFF are not used as mail-boxes by ignoring the interrupt, but as part of the random access memory. Refer to Truth Table IV for the interrupt operation.

## Busy Logic

Busy Logic provides a hardware indication that both ports of the RAM have accessed the same location at the same time. It also allows one of the two accesses to proceed and signals the other side that the RAM is "Busy". The  $\overline{\text{BUSY}}$  pin can then be used to stall the access until the operation on the other side is completed. If a write operation has been attempted from the side that receives a  $\overline{\text{BUSY}}$  indication, the write signal is gated internally to prevent the write from proceeding.

The use of  $\overline{\text{BUSY}}$  logic is not required or desirable for all applications. In some cases it may be useful to logically OR the  $\overline{\text{BUSY}}$  outputs together and use any  $\overline{\text{BUSY}}$  indication as an interrupt source to flag the event of an illegal or illogical operation. If the write inhibit function of busy logic is not desirable, the  $\overline{\text{BUSY}}$  logic can be disabled by placing the part in slave mode with the  $\overline{\text{M/S}}$  pin. Once in slave mode the  $\overline{\text{BUSY}}$  pin operates solely as a write inhibit input pin. Normal operation can be programmed by tying the  $\overline{\text{BUSY}}$  pins HIGH. If desired, unintended write operations can be prevented to a port by tying the  $\overline{\text{BUSY}}$  pin for that port LOW.

The  $\overline{\text{BUSY}}$  outputs on the IDT7027 RAM in master mode, are push-pull type outputs and do not require pull up resistors to operate. If these RAMs are being expanded in depth, then the  $\overline{\text{BUSY}}$  indication for the resulting array requires the use of an external AND gate.

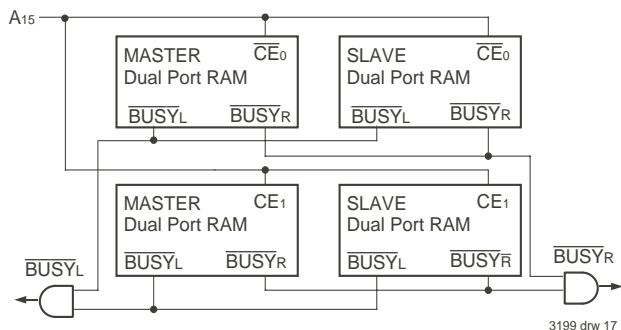

Figure 3. Busy and chip enable routing for both width and depth expansion with IDT7027 RAMs.

## Width Expansion with Busy Logic Master/Slave Arrays

When expanding an IDT7027 RAM array in width while using  $\overline{\text{BUSY}}$  logic, one master part is used to decide which side of the RAM array will receive a  $\overline{\text{BUSY}}$  indication, and to output that indication. Any number of slaves to be addressed in the same address range as the master, use the  $\overline{\text{BUSY}}$  signal as a write inhibit signal. Thus on the IDT7027 RAM the  $\overline{\text{BUSY}}$  pin is an output if the part is used as a Master ( $\overline{\text{M/S}}$  pin = VIH), and the  $\overline{\text{BUSY}}$  pin is an input if the part used as a Slave ( $\overline{\text{M/S}}$  pin = VIL) as shown in Figure 3.

If two or more master parts were used when expanding in width, a split decision could result with one master indicating  $\overline{\text{BUSY}}$  on one side of the array and another master indicating  $\overline{\text{BUSY}}$  on one other side of the array. This would inhibit the write operations from one port for part of a word and inhibit the write operations from the other port for the other part of the word.

The  $\overline{\text{BUSY}}$  arbitration, on a master, is based on the chip enable and address signals only. It ignores whether an access is a read or write. In a master/slave array, both address and chip enable must be valid long enough for a  $\overline{\text{BUSY}}$  flag to be output from the master before the actual write

pulse can be initiated with either the  $\overline{\text{R/W}}$  signal or the byte enables. Failure to observe this timing can result in a glitched internal write inhibit signal and corrupted data in the slave.

## Semaphores

The IDT7027 is a fast Dual-Port 32K x 16 CMOS Static RAM with an additional 8 address locations dedicated to binary semaphore flags. These flags allow either processor on the left or right side of the Dual-Port SRAM to claim a privilege over the other processor for functions defined by the system designer's software. As an example, the semaphore can be used by one processor to inhibit the other from accessing a portion of the Dual-Port SRAM or any other shared resource.

The Dual-Port SRAM features a fast access time, and both ports are completely independent of each other. This means that the activity on the left port in no way slows the access time of the right port. Both ports are identical in function to standard CMOS Static RAM and can be read from, or written to, at the same time with the only possible conflict arising from the simultaneous writing of, or a simultaneous READ/WRITE of, a non-semaphore location. Semaphores are protected against such ambiguous situations and may be used by the system program to avoid any conflicts in the non-semaphore portion of the Dual-Port SRAM. These devices have an automatic power-down feature controlled by  $\overline{\text{CE}}$  the Dual-Port SRAM enable, and  $\overline{\text{SEM}}$ , the semaphore enable. The  $\overline{\text{CE}}$  and  $\overline{\text{SEM}}$  pins control on-chip power down circuitry that permits the respective port to go into standby mode when not selected. This is the condition which is shown in Truth Table II where  $\overline{\text{CE}}$  and  $\overline{\text{SEM}} = \text{VIH}$ .

Systems which can best use the IDT7027 contain multiple processors or controllers and are typically very high-speed systems which are software controlled or software intensive. These systems can benefit from a performance increase offered by the IDT7027's hardware semaphores, which provide a lockout mechanism without requiring complex programming.

Software handshaking between processors offers the maximum in system flexibility by permitting shared resources to be allocated in varying configurations. The IDT7027 does not use its semaphore flags to control any resources through hardware, thus allowing the system designer total flexibility in system architecture.

An advantage of using semaphores rather than the more common methods of hardware arbitration is that wait states are never incurred in either processor. This can prove to be a major advantage in very high-speed systems.

## How the Semaphore Flags Work

The semaphore logic is a set of eight latches which are independent of the Dual-Port SRAM. These latches can be used to pass a flag, or token, from one port to the other to indicate that a shared resource is in use. The semaphores provide a hardware assist for a use assignment method called "Token Passing Allocation." In this method, the state of a semaphore latch is used as a token indicating that shared resource is in use. If the left processor wants to use this resource, it requests the token by setting the latch. This processor then verifies its success in setting the latch by reading it. If it was successful, it proceeds to assume control over the shared resource. If it was not successful in setting the latch, it determines that the right side processor has set the latch first, has the token and is using the shared resource. The left processor can then either repeatedly request that semaphore's status or remove its request for that semaphore to

perform another task and occasionally attempt again to gain control of the token via the set and test sequence. Once the right side has relinquished the token, the left side should succeed in gaining control.

The semaphore flags are active low. A token is requested by writing a zero into a semaphore latch and is released when the same side writes a one to that latch.

The eight semaphore flags reside within the IDT7027 in a separate memory space from the Dual-Port SRAM. This address space is accessed by placing a low input on the  $\overline{SEM}$  pin (which acts as a chip select for the semaphore flags) and using the other control pins (Address,  $\overline{OE}$ , and R/W) as they would be used in accessing a standard Static RAM. Each of the flags has a unique address which can be accessed by either side through address pins A0–A2. When accessing the semaphores, none of the other address pins has any effect.

When writing to a semaphore, only data pin Do is used. If a LOW level is written into an unused semaphore location, that flag will be set to a zero on that side and a one on the other side (see Truth Table VI). That semaphore can now only be modified by the side showing the zero. When a one is written into the same location from the same side, the flag will be set to a one for both sides (unless a semaphore request from the other side is pending) and then can be written to by both sides. The fact that the side which is able to write a zero into a semaphore subsequently locks out writes from the other side is what makes semaphore flags useful in interprocessor communications. (A thorough discussion on the use of this feature follows shortly.) A zero written into the same location from the other side will be stored in the semaphore request latch for that side until the semaphore is freed by the first side.

When a semaphore flag is read, its value is spread into all data bits so that a flag that is a one reads as a one in all data bits and a flag containing a zero reads as all zeros. The read value is latched into one side's output register when that side's semaphore select ( $\overline{SEM}$ ) and output enable ( $\overline{OE}$ ) signals go active. This serves to disallow the semaphore from changing state in the middle of a read cycle due to a write cycle from the other side. Because of this latch, a repeated read of a semaphore in a test loop must cause either signal ( $\overline{SEM}$  or  $\overline{OE}$ ) to go inactive or the output will never change.

A sequence WRITE/READ must be used by the semaphore in order to guarantee that no system level contention will occur. A processor requests access to shared resources by attempting to write a zero into a semaphore location. If the semaphore is already in use, the semaphore request latch will contain a zero, yet the semaphore flag will appear as one, a fact which the processor will verify by the subsequent read (see Truth Table VI). As an example, assume a processor writes a zero to the left port at a free semaphore location. On a subsequent read, the processor will verify that it has written successfully to that location and will assume control over the resource in question. Meanwhile, if a processor on the right side attempts to write a zero to the same semaphore flag it will fail, as will be verified by the fact that a one will be read from that semaphore on the right

side during subsequent read. Had a sequence of READ/WRITE been used instead, system contention problems could have occurred during the gap between the read and write cycles.

It is important to note that a failed semaphore request must be followed by either repeated reads or by writing a one into the same location. The reason for this is easily understood by looking at the simple logic diagram of the semaphore flag in Figure 4. Two semaphore request latches feed into a semaphore flag. Whichever latch is first to present a zero to the

Figure 4. IDT7027 Semaphore Logic

3199 drw 18

semaphore flag will force its side of the semaphore flag LOW and the other side HIGH. This condition will continue until a one is written to the same semaphore request latch. Should the other side's semaphore request latch have been written to a zero in the meantime, the semaphore flag will flip over to the other side as soon as a one is written into the first side's request latch. The second side's flag will now stay LOW until its semaphore request latch is written to a one. From this it is easy to understand that, if a semaphore is requested and the processor which requested it no longer needs the resource, the entire system can hang up until a one is written into that semaphore request latch.

The critical case of semaphore timing is when both sides request a single token by attempting to write a zero into it at the same time. The semaphore logic is specially designed to resolve this problem. If simultaneous requests are made, the logic guarantees that only one side receives the token. If one side is earlier than the other in making the request, the first side to make the request will receive the token. If both requests arrive at the same time, the assignment will be arbitrarily made to one port or the other.

One caution that should be noted when using semaphores is that semaphores alone do not guarantee that access to a resource is secure. As with any powerful programming technique, if semaphores are misused or misinterpreted, a software error can easily happen.

Initialization of the semaphores is not automatic and must be handled via the initialization program at power-up. Since any semaphore request flag which contains a zero must be reset to a one, all semaphores on both sides should have a one written into them at initialization from both sides to assure that they will be free when needed.

06/08/18:	<ul style="list-style-type: none"> <li>Product Discontinuation Notice - PDN# SP-17-02</li> <li>Last time buy expires June 15, 2018</li> </ul>
06/03/19:	<ul style="list-style-type: none"> <li>Page 1 &amp; 19 Updated Industrial speed grade offering in Features and Ordering Information</li> <li>Page 2 Changed diagram for the PNG100 pin configuration by rotating package pin labels and pin numbers 90 degrees counter clockwise to reflect pin 1 orientation and added pin 1 dot at pin 1</li> <li>Aligned the top and bottom pin labels in the standard direction</li> <li>Added IDT logo to the PNG100 pin configuration and changed the text to be in alignment with new diagram marking specs</li> <li>Updated footnote reference for PNG100</li> <li>Page 2, 3 &amp; 19 The package codes for PN100 changed to PNG100 and for G108 changed to GU108 respectively to match standard package codes</li> <li>Page 19 Revised LEAD FINISH note to indicate Obsolete</li> <li>Page 19 Added Orderable Part Information</li> </ul>

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
  - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
  - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.4.0-1 November 2017)
