

Features

- ◆ True Dual-Port memory cells which allow simultaneous access of the same memory location
- ◆ High-speed access
 - Commercial: 10/12/15ns (max.)
 - Industrial: 10/12ns (max.)
- ◆ RapidWrite Mode simplifies high-speed consecutive write cycles
- ◆ Dual chip enables allow for depth expansion without external logic
- ◆ IDT70T633/1 easily expands data bus width to 36 bits or more using the Master/Slave select when cascading more than one device
- ◆ $M/\overline{S} = V_{IH}$ for \overline{BUSY} output flag on Master, $M/\overline{S} = V_{IL}$ for \overline{BUSY} input on Slave
- ◆ Busy and Interrupt Flags
- ◆ On-chip port arbitration logic
- ◆ Full hardware support of semaphore signaling between ports on-chip
- ◆ Fully asynchronous operation from either port
- ◆ Separate byte controls for multiplexed bus and bus matching compatibility
- ◆ Sleep Mode Inputs on both ports
- ◆ Supports JTAG features compliant to IEEE 1149.1 in BGA-208 and BGA-256 packages
- ◆ Single 2.5V ($\pm 100mV$) power supply for core
- ◆ LVTTTL-compatible, selectable 3.3V ($\pm 150mV$)/2.5V ($\pm 100mV$) power supply for I/Os and control signals on each port
- ◆ Available in a 256-ball Ball Grid Array and 208-ball fine pitch Ball Grid Array
- ◆ Industrial temperature range ($-40^{\circ}C$ to $+85^{\circ}C$) is available for selected speeds
- ◆ Green parts available, see ordering information

Functional Block Diagram

NOTES:

1. Address A18x is a NC for IDT70T631.
2. \overline{BUSY} is an input as a Slave ($M/\overline{S}=V_{IL}$) and an output when it is a Master ($M/\overline{S}=V_{IH}$).
3. \overline{BUSY} and \overline{INT} are non-tri-state totem-pole outputs (push-pull).
4. The sleep mode pin shuts off all dynamic inputs, except JTAG inputs, when asserted. \overline{OPTx} , \overline{INTx} , M/\overline{S} and the sleep mode pins themselves (ZZx) are not affected during sleep mode.

5670 drw 01

Description

The IDT70T633/1 is a high-speed 512/256K x 18 Asynchronous Dual-Port Static RAM. The IDT70T633/1 is designed to be used as a stand-alone 9216/4608K-bit Dual-Port RAM or as a combination MASTER/SLAVE Dual-Port RAM for 36-bit-or-more word system. Using the IDT MASTER/SLAVE Dual-Port RAM approach in 36-bit or wider memory system applications results in full-speed, error-free operation without the need for additional discrete logic.

This device provides two independent ports with separate control, address, and I/O pins that permit independent, asynchronous access for reads or writes to any location in memory. An automatic power down

feature controlled by the chip enables (either $\overline{CE0}$ or CE1) permit the on-chip circuitry of each port to enter a very low standby power mode.

The IDT70T633/1 has a RapidWrite Mode which allows the designer to perform back-to-back write operations without pulsing the R/\overline{W} input each cycle. This is especially significant at the 10ns cycle times of the IDT70T633/1, easing design considerations at these high performance levels.

The 70T633/1 can support an operating voltage of either 3.3V or 2.5V on one or both ports, controlled by the OPT pins. The power supply for the core of the device (V_{DD}) remains at 2.5V.

\overline{TRST}		Reset (Initialize TAP Controller) (Input)

5670 tbl 01

NOTES:

- Address A_{18x} is a NC for IDT70T631.
- V_{DD} , OPT_x , and V_{DD0x} must be set to appropriate operating levels prior to applying inputs on I/O_x .
- OPT_x selects the operating voltage levels for the I/O s and controls on that port. If OPT_x is set to V_{DD} (2.5V), then that port's I/O s and controls will operate at 3.3V levels and V_{DD0x} must be supplied at 3.3V. If OPT_x is set to V_{SS} (0V), then that port's I/O s and controls will operate at 2.5V levels and V_{DD0x} must be supplied at 2.5V. The OPT pins are independent of one another—both ports can operate at 3.3V levels, both can operate at 2.5V levels, or either can operate at 3.3V with the other at 2.5V.
- The sleep mode pin shuts off all dynamic inputs, except JTAG inputs, when asserted. OPT_x , \overline{INT}_x , M/\overline{S} and the sleep mode pins themselves (ZZ_x) are not affected during sleep mode. It is recommended that boundary scan not be operated during sleep mode.
- \overline{BUSY} is an input as a Slave ($M/\overline{S}=V_{IL}$) and an output when it is a Master ($M/\overline{S}=V_{IH}$).

Truth Table I—Read/Write and Enable Control⁽¹⁾

\overline{OE}	\overline{SEM}	\overline{CE}_0	CE_1	\overline{UB}	\overline{LB}	R/W	ZZ	Upper Byte I/O ₉₋₁₇	Lower Byte I/O ₀₋₈	MODE
X	H	H	X	X	X	X	L	High-Z	High-Z	Deselected—Power Down
X	H	X	L	X	X	X	L	High-Z	High-Z	Deselected—Power Down
X	H	L	H	H	H	X	L	High-Z	High-Z	Both Bytes Deselected
X	H	L	H	H	L	L	L	High-Z	DIN	Write to Lower Byte

X	H	L	H	L	L	L	L	DIN	DIN	Write to Both Bytes
L	H	L	H	H	L	H	L	High-Z	DOUT	Read Lower Byte
L	H	L	H	L	H	H	L	DOUT	High-Z	Read Upper Byte
L	H	L	H	L	L	H	L	DOUT	DOUT	Read Both Bytes
H	H	L	H	L	L	X	L	High-Z	High-Z	Outputs Disabled
X	X	X	X	X	X	X	H	High-Z	High-Z	High-Z Sleep Mode

5670 tbl 02

NOTE:

- "H" = V_{IH}, "L" = V_{IL}, "X" = Don't Care.

Truth Table II – Semaphore Read/Write Control⁽¹⁾

Inputs ⁽¹⁾						Outputs		Mode
$\overline{CE}^{(2)}$	R/W	\overline{OE}	\overline{UB}	\overline{LB}	\overline{SEM}	I/O ₁₋₁₇	I/O ₀	
H	H	L	L	L	L	DATA _{OUT}	DATA _{OUT}	Read Data in Semaphore Flag ⁽³⁾
H	↑	X	X	L	L	X	DATA _{IN}	Write I/O ₀ into Semaphore Flag
L	X	X	X	X	L	—	—	Not Allowed

5670 tbl 03

NOTES:

- There are eight semaphore flags written to I/O₀ and read from all the I/Os (I/O₀-I/O₁₇). These eight semaphore flags are addressed by A₀-A₂.
- \overline{CE} = L occurs when \overline{CE}_0 = V_{IL} and CE_1 = V_{IH}. \overline{CE} = H when \overline{CE}_0 = V_{IH} and/or CE_1 = V_{IL}.
- Each byte is controlled by the respective \overline{UB} and \overline{LB} . To read data \overline{UB} and/or \overline{LB} = V_{IL}.

Recommended Operating Temperature and Supply Voltage⁽¹⁾

Grade	Ambient Temperature	GND	V _{DD}
Commercial	0°C to +70°C	0V	2.5V \pm 100mV
Industrial	-40°C to +85°C	0V	2.5V \pm 100mV

5670 tbl 04

NOTE:

1. This is the parameter T_A. This is the "instant on" case temperature.

Absolute Maximum Ratings⁽¹⁾

Symbol	Rating	Commercial & Industrial	Unit
V _{TERM} (V _{DD})	V _{DD} Terminal Voltage with Respect to GND	-0.5 to 3.6	V
V _{TERM} ⁽²⁾ (V _{DD0})	V _{DD0} Terminal Voltage with Respect to GND	-0.3 to V _{DD0} + 0.3	V
V _{TERM} ⁽²⁾ (INPUTS and I/O's)	Input and I/O Terminal Voltage with Respect to GND	-0.3 to V _{DD0} + 0.3	V
T _{BIAS} ⁽³⁾	Temperature Under Bias	-55 to +125	°C
T _{STG}	Storage Temperature	-65 to +150	°C
T _{JN}	Junction Temperature	+150	°C
I _{OUT} (For V _{DD0} = 3.3V)	DC Output Current	50	mA
I _{OUT} (For V _{DD0} = 2.5V)	DC Output Current	40	mA

5670 tbl 07

NOTES:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- This is a steady-state DC parameter that applies after the power supply has reached its nominal operating value. Power sequencing is not necessary; however, the voltage on any Input or I/O pin cannot exceed V_{DD0} during power supply ramp up.
- Ambient Temperature under DC Bias. No AC Conditions. Chip Deselected.

Capacitance⁽¹⁾

(T_A = +25°C, F = 1.0MHz) TQFP ONLY

Symbol	Parameter	Conditions ⁽²⁾	Max.	Unit
C _{IN}	Input Capacitance	V _{IN} = 3dV	8	pF
C _{OUT} ⁽³⁾	Output Capacitance	V _{OUT} = 3dV	10.5	pF

5670 tbl 08

NOTES:

- These parameters are determined by device characterization, but are not production tested.
- 3dV references the interpolated capacitance when the input and output switch from 0V to 3V or from 3V to 0V.
- C_{OUT} also references C_{I/O}.

Recommended DC Operating Conditions with V_{DD0} at 2.5V

Symbol	Parameter	Min.	Typ.	Max.	Unit
V _{DD}	Core Supply Voltage	2.4	2.5	2.6	V
V _{DD0}	I/O Supply Voltage ⁽³⁾	2.4	2.5	2.6	V
V _{SS}	Ground	0	0	0	V
V _{IH}	Input High Voltage (Address, Control & Data I/O Inputs) ⁽³⁾	1.7	—	V _{DD0} + 100mV ⁽²⁾	V
V _{IH}	Input High Voltage - JTAG	1.7	—	V _{DD} + 100mV ⁽²⁾	V
V _{IH}	Input High Voltage - ZZ, OPT, M/S	V _{DD} - 0.2V	—	V _{DD} + 100mV ⁽²⁾	V
V _{IL}	Input Low Voltage	-0.3 ⁽¹⁾	—	0.7	V
V _{IL}	Input Low Voltage - ZZ, OPT, M/S	-0.3 ⁽¹⁾	—	0.2	V

5670 tbl 05

NOTES:

- V_{IL} (min.) = -1.0V for pulse width less than t_{rc}/2 or 5ns, whichever is less.
- V_{IH} (max.) = V_{DD0} + 1.0V for pulse width less than t_{rc}/2 or 5ns, whichever is less.
- To select operation at 2.5V levels on the I/Os and controls of a given port, the OPT pin for that port must be set to V_{SS} (0V), and V_{DD0X} for that port must be supplied as indicated above.

Recommended DC Operating Conditions with V_{DD0} at 3.3V

Symbol	Parameter	Min.	Typ.	Max.	Unit
V _{DD}	Core Supply Voltage	2.4	2.5	2.6	V
V _{DD0}	I/O Supply Voltage ⁽³⁾	3.15	3.3	3.45	V
V _{SS}	Ground	0	0	0	V
V _{IH}	Input High Voltage (Address, Control & Data I/O Inputs) ⁽³⁾	2.0	—	V _{DD0} + 150mV ⁽²⁾	V
V _{IH}	Input High Voltage - JTAG	1.7	—	V _{DD} + 100mV ⁽²⁾	V
V _{IH}	Input High Voltage - ZZ, OPT, M/S	V _{DD} - 0.2V	—	V _{DD} + 100mV ⁽²⁾	V
V _{IL}	Input Low Voltage	-0.3 ⁽¹⁾	—	0.8	V
V _{IL}	Input Low Voltage - ZZ, OPT, M/S	-0.3 ⁽¹⁾	—	0.2	V

5670 tbl 06

NOTES:

- V_{IL} (min.) = -1.0V for pulse width less than t_{rc}/2 or 5ns, whichever is less.
- V_{IH} (max.) = V_{DD0} + 1.0V for pulse width less than t_{rc}/2 or 5ns, whichever is less.
- To select operation at 3.3V levels on the I/Os and controls of a given port, the OPT pin for that port must be set to V_{DD} (2.5V), and V_{DD0X} for that port must be supplied as indicated above.

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range ($V_{DD} = 2.5V \pm 100mV$)

Symbol	Parameter	Test Conditions	70T633/1S		Unit
			Min.	Max.

5670 tbl 10

NOTES:

- At $f = f_{MAX}$, address and control lines (except Output Enable) are cycling at the maximum frequency read cycle of 1/trc, using "AC TEST CONDITIONS".
- $f = 0$ means no address or control lines change. Applies only to input at CMOS level standby.
- $V_{DD} = 2.5V, T_A = 25^\circ C$ for Typ. values, and are not production tested. $I_{DD} \text{ at } f=0 = 100mA$ (Typ).
- $\overline{CE}_X = V_{IL}$ means $\overline{CE}_{0X} = V_{IL}$ and $CE_{1X} = V_{IH}$
 $\overline{CE}_X = V_{IH}$ means $\overline{CE}_{0X} = V_{IH}$ or $CE_{1X} = V_{IL}$
 $\overline{CE}_X \leq 0.2V$ means $\overline{CE}_{0X} \leq 0.2V$ and $CE_{1X} \geq V_{DDQ} - 0.2V$
 $\overline{CE}_X \geq V_{DDQ} - 0.2V$ means $\overline{CE}_{0X} \geq V_{DDQ} - 0.2V$ or $CE_{1X} \leq 0.2V$
 "X" represents "L" for left port or "R" for right port.
- I_{SB1}, I_{SB2} and I_{SB4} will all reach full standby levels (I_{SB3}) on the appropriate port(s) if ZZL and /or ZZR = V_{IH}.

5670 tbl 13

NOTES:

1. Transition is measured 0mV from Low or High-impedance voltage with Output Test Load (Figure 1).
2. This parameter is guaranteed by device characterization, but is not production tested.
3. To access RAM, $\overline{CE} = V_{IL}$ and $\overline{SEM} = V_{IH}$. To access semaphore, $\overline{CE} = V_{IH}$ and $\overline{SEM} = V_{IL}$. Either condition must be valid for the entire t_{ew} time. $\overline{CE} = V_{IL}$ when $\overline{CE}_0 = V_{IL}$ and $\overline{CE}_1 = V_{IH}$. $\overline{CE} = V_{IH}$ when $\overline{CE}_0 = V_{IH}$ and/or $\overline{CE}_1 = V_{IL}$.
4. These values are valid regardless of the power supply level selected for I/O and control signals (3.3V/2.5V). See page 6 for details.

Waveform of Read Cycles⁽⁵⁾

5670 drw 06

NOTES:

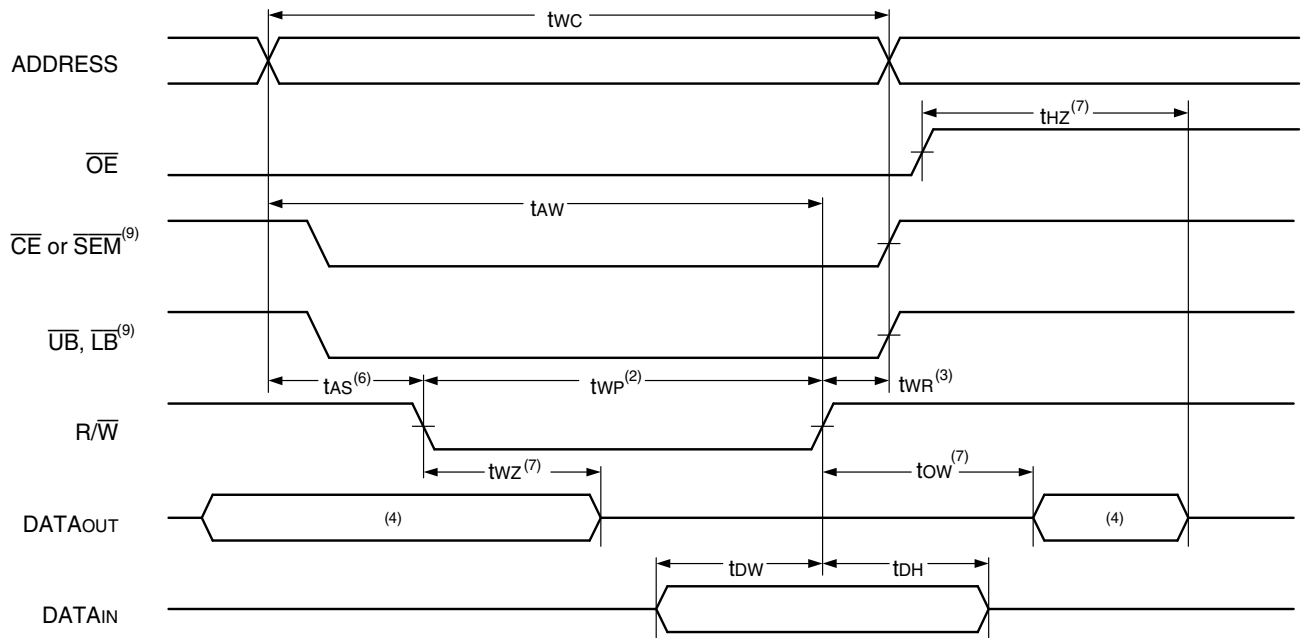

1. Timing depends on which signal is asserted last, OE, CE, LB or UB.
2. Timing depends on which signal is de-asserted first, CE, OE, LB or UB.
3. tBDD delay is required only in cases where the opposite port is completing a write operation to the same address location. For simultaneous read operations BUSY has no relation to valid output data.
4. Start of valid data depends on which timing becomes effective last: tAOE, tACE, tAA, tABE, or tBDD.
5. SEM = VIH.
6. CE = L occurs when CE0 = VIL and CE1 = VIH. CE = H when CE0 = VIH and/or CE1 = VIL.

Timing of Power-Up Power-Down

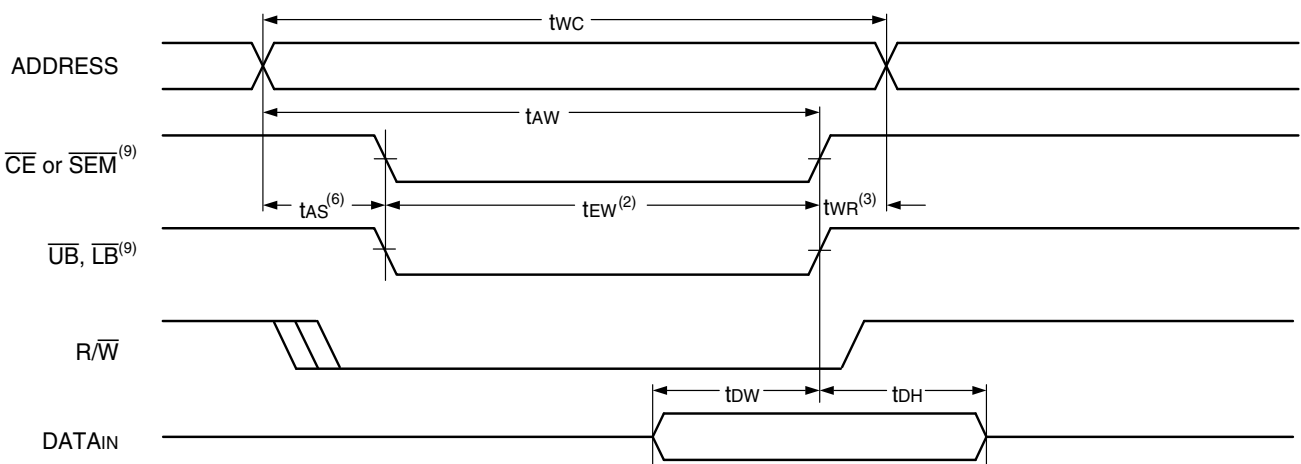

5670 drw 07

Timing Waveform of Write Cycle No. 1, R/\overline{W} Controlled Timing^(1,5,8)

5670 drw 10

Timing Waveform of Write Cycle No. 2, \overline{CE} Controlled Timing^(1,5,8)

5670 drw 11

NOTES:

1. R/\overline{W} or \overline{CE} or \overline{UB} or $\overline{LB} = V_{IH}$ during all address transitions.
2. A write occurs during the overlap (t_{EW} or t_{WP}) of a $\overline{CE} = V_{IL}$ and a $R/\overline{W} = V_{IL}$ for memory array writing cycle.
3. t_{WR} is measured from the earlier of \overline{CE} or R/\overline{W} (or \overline{SEM} or R/\overline{W}) going HIGH to the end of write cycle.
4. During this period, the I/O pins are in the output state and input signals must not be applied.
5. If the \overline{CE} or $\overline{SEM} = V_{IL}$ transition occurs simultaneously with or after the $R/\overline{W} = V_{IL}$ transition, the outputs remain in the High-impedance state.
6. Timing depends on which enable signal is asserted last, \overline{CE} or R/\overline{W} .
7. This parameter is guaranteed by device characterization, but is not production tested. Transition is measured 0mV from steady state with the Output Test Load (Figure 1).
8. If $\overline{OE} = V_{IL}$ during R/\overline{W} controlled write cycle, the write pulse width must be the larger of t_{WP} or $(t_{WZ} + t_{OW})$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{OW} . If $\overline{OE} = V_{IH}$ during an R/\overline{W} controlled write cycle, this requirement does not apply and the write pulse can be as short as the specified t_{WP} .
9. To access RAM, $\overline{CE} = V_{IL}$ and $\overline{SEM} = V_{IH}$. To access semaphore, $\overline{CE} = V_{IH}$ and $\overline{SEM} = V_{IL}$. t_{EW} must be met for either condition. $\overline{CE} = V_{IL}$ when $\overline{CE}_0 = V_{IL}$ and $CE_1 = V_{IH}$. $\overline{CE} = V_{IH}$ when $\overline{CE}_0 = V_{IH}$ and/or $CE_1 = V_{IL}$.

RapidWrite Mode Write Cycle

Unlike other vendors' Asynchronous Random Access Memories, the IDT70T633/1 is capable of performing multiple back-to-back write operations without having to pulse the R/\overline{W} , \overline{CE} , or \overline{BEn} signals high during address transitions. This RapidWrite Mode functionality allows the system designer to achieve optimum back-to-back write cycle performance without the difficult task of generating narrow reset pulses every cycle, simplifying system design and reducing time to market.

During this new RapidWrite Mode, the end of the write cycle is now defined by the ending address transition, instead of the R/\overline{W} or \overline{CE} or \overline{BEn} transition to the inactive state. R/\overline{W} , \overline{CE} , and \overline{BEn} can be held active throughout the address transition between write cycles.

Care must be taken to still meet the Write Cycle time (t_{wc}), the time in which the Address inputs must be stable. Input data setup and hold times (t_{dW} and t_{dH}) will now be referenced to the ending address transition. In this RapidWrite Mode the I/O will remain in the Input mode for the duration of the operations due to R/\overline{W} being held low. All standard Write Cycle specifications must be adhered to. However, t_{AS} and t_{WR} are only applicable when switching between read and write operations. Also, there are two additional conditions on the Address Inputs that must also be met to ensure correct address controlled writes. These specifications, the Allowable Address Skew (t_{AAS}) and the Address Rise/Fall time (t_{ARF}), must be met to use the RapidWrite Mode. If these conditions are not met there is the potential for inadvertent write operations at random intermediate locations as the device transitions between the desired write addresses.

Timing Waveform of Write Cycle No. 3, RapidWrite Mode Write Cycle^(1,3)

5670 drw 08

NOTES:

1. $\overline{OE} = V_{IL}$ for this timing waveform as shown. \overline{OE} may equal V_{IH} with same write functionality; I/O would then always be in High-Z state.
2. A write occurs during the overlap (t_{EW} or t_{WP}) of a $\overline{CE} = V_{IL}$, $\overline{BEn} = V_{IL}$, and a $R/\overline{W} = V_{IL}$ for memory array writing cycle. The last transition LOW of \overline{CE} , \overline{BEn} , and R/\overline{W} initiates the write sequence. The first transition HIGH of \overline{CE} , \overline{BEn} , and R/\overline{W} terminates the write sequence.
3. If the \overline{CE} or $\overline{SEM} = V_{IL}$ transition occurs simultaneously with or after the $R/\overline{W} = V_{IL}$ transition, the outputs remain in the High-impedance state.
4. The timing represented in this cycle can be repeated multiple times to execute sequential RapidWrite Mode writes.
5. This parameter is guaranteed by device characterization, but is not production tested. Transition is measured 0mV from steady state with the Output Test Load (Figure 1).
6. To access RAM, $\overline{CE} = V_{IL}$ and $\overline{SEM} = V_{IH}$. To access semaphore, $\overline{CE} = V_{IH}$ and $\overline{SEM} = V_{IL}$. t_{EW} must be met for either condition. $\overline{CE} = V_{IL}$ when $\overline{CE}_0 = V_{IL}$ and $CE_1 = V_{IH}$. $\overline{CE} = V_{IH}$ when $\overline{CE}_0 = V_{IH}$ and/or $CE_1 = V_{IL}$.

AC Electrical Characteristics over the Operating Temperature Range and Supply Voltage Range for RapidWrite Mode Write Cycle⁽¹⁾

Symbol	Parameter	Min	Max	Unit
t _{AAS}	Allowable Address Skew for RapidWrite Mode	—	1	ns
t _{ARF}	Address Rise/Fall Time for RapidWrite Mode	1.5	—	V/ns

5670 tbl 14

NOTE:

1. Timing applies to all speed grades when utilizing the RapidWrite Mode Write Cycle.

Timing Waveform of Address Inputs for RapidWrite Mode Write Cycle

NOTE:

1. A17 for IDT70T631.

5670 drw 09

Timing Waveform of Semaphore Read after Write Timing, Either Side⁽¹⁾

5670 drw 12

NOTES:

1. $\overline{CE}_0 = V_{IH}$ and $CE_1 = V_{IL}$ are required for the duration of both the write cycle and the read cycle waveforms shown above. Refer to Truth Table II for details and for appropriate $\overline{UB}/\overline{LB}$ controls.
2. "DATAOUT VALID" represents all I/O's (I/O₀ - I/O₁₇) equal to the semaphore value.

Timing Waveform of Semaphore Write Contention^(1,3,4)

5670 drw 13

NOTES:

1. $D_{0R} = D_{0L} = V_{IL}$, $\overline{CE}_{0L} = \overline{CE}_{0R} = V_{IH}$; $CE_{1L} = CE_{1R} = V_{IL}$. Refer also to Truth Table II for appropriate $\overline{UB}/\overline{LB}$ controls.
2. All timing is the same for left and right ports. Port "A" may be either left or right port. "B" is the opposite from port "A".
3. This parameter is measured from R/\overline{W}^A or \overline{SEM}^A going HIGH to R/\overline{W}^B or \overline{SEM}^B going HIGH.
4. If t_{SPS} is not satisfied, the semaphore will fall positively to one side or the other, but there is no guarantee which side will be granted the semaphore flag.

5670 tbl 15

NOTES:

1. Port-to-port delay through RAM cells from writing port to reading port, refer to "Timing Waveform of Write with Port-to-Port Read and $\overline{\text{BUSY}}$ (M/S = VIH)".
2. To ensure that the earlier of the two ports wins.
3. tBDD is a calculated parameter and is the greater of the Max. spec, tWDD – tWP (actual), or tDDD – tOW (actual).
4. To ensure that the write cycle is inhibited on port "B" during contention on port "A".
5. To ensure that a write cycle is completed on port "B" after contention on port "A".

AC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range^(1,2,3)

Symbol	Parameter	70T633/1S10 Com'l & Ind		70T633/1S12 Com'l & Ind		70T633/1S15 Com'l Only	
		Min.	Max.	Min.	Max.	Min.	Max.
SLEEP MODE TIMING (ZZx=VIH)							
tZS	Sleep Mode Set Time	10	—	12	—	15	—
tZR	Sleep Mode Reset Time	10	—	12	—	15	—
tZPD	Sleep Mode Power Down Time ⁽⁴⁾	10	—	12	—	15	—
tZPU	Sleep Mode Power Up Time ⁽⁴⁾	—	0	—	0	—	0

5670 tbl 15a

NOTES:

1. Timing is the same for both ports.
2. The sleep mode pin shuts off all dynamic inputs, except JTAG inputs, when asserted. OPTx, $\overline{\text{INTx}}$, M/S and the sleep mode pins themselves (ZZx) are not affected during sleep mode. It is recommended that boundary scan not be operated during sleep mode.
3. These values are valid regardless of the power supply level selected for I/O and control signals (3.3V/2.5V). See page 5 for details.
4. This parameter is guaranteed by device characterization, but is not production tested.

Timing Waveform of Write with Port-to-Port Read and **BUSY** ($M/\bar{S} = V_{IH}$)^(2,4,5)

5670 drw 14

NOTES:

1. To ensure that the earlier of the two ports wins. tAPs is ignored for $M/\bar{S} = V_{IL}$ (SLAVE).
2. $\overline{CE}_{0L} = \overline{CE}_{0R} = V_{IL}$; $CE_{1L} = CE_{1R} = V_{IH}$.
3. $\overline{OE} = V_{IL}$ for the reading port.
4. If $M/\bar{S} = V_{IL}$ (slave), \overline{BUSY} is an input. Then for this example $\overline{BUSY}^A = V_{IH}$ and \overline{BUSY}^B input is shown above.
5. All timing is the same for left and right ports. Port "A" may be either the left or right port. Port "B" is the port opposite from port "A".

Timing Waveform of Write with **BUSY** ($M/\bar{S} = V_{IL}$)

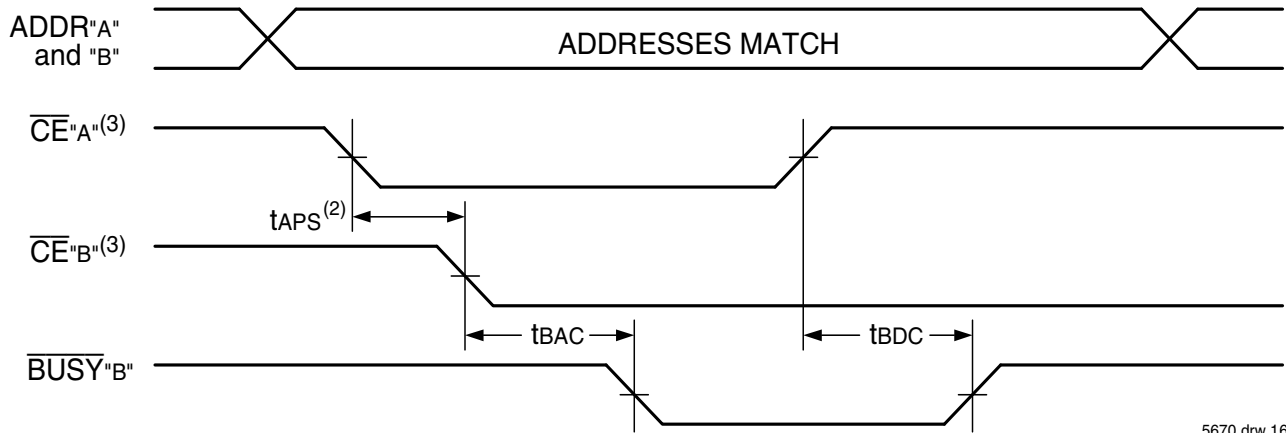

5670 drw 15

NOTES:

1. twH must be met for both \overline{BUSY} input (SLAVE) and output (MASTER).
2. \overline{BUSY} is asserted on port "B" blocking R/W'B', until \overline{BUSY}^B goes HIGH.
3. twB only applies to the slave mode.

Waveform of **BUSY** Arbitration Controlled by **CE** Timing ($M/\bar{S} = V_{IH}$)⁽¹⁾

5670 drw 16

Waveform of **BUSY** Arbitration Cycle Controlled by Address Match Timing ($M/\bar{S} = V_{IH}$)^(1,3,4)

5670 drw 17

NOTES:

1. All timing is the same for left and right ports. Port "A" may be either the left or right port. Port "B" is the port opposite from port "A".
2. If tAPS is not satisfied, the BUSY signal will be asserted on one side or another but there is no guarantee on which side BUSY will be asserted.
3. $\overline{CE}_x = V_{IL}$ when $\overline{CE}_{0x} = V_{IL}$ and $CE_{1x} = V_{IH}$. $\overline{CE}_x = V_{IH}$ when $\overline{CE}_{0x} = V_{IH}$ and/or $CE_{1x} = V_{IL}$.
4. $\overline{CE}_{0x} = \overline{OE}_x = \overline{LB}_x = \overline{UB}_x = V_{IL}$. $CE_{1x} = V_{IH}$.

AC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range^(1,2)

Symbol	Parameter	70T633/1S10 Com'l & Ind		70T633/1S12 Com'l & Ind		70T633/1S15 Com'l Only		Unit
		Min.	Max.	Min.	Max.	Min.	Max.	
INTERRUPT TIMING								
tAS	Address Set-up Time	0	—	0	—	0	—	ns
tWR	Write Recovery Time	0	—	0	—	0	—	ns
tINS	Interrupt Set Time	—	10	—	12	—	15	ns
tINR	Interrupt Reset Time	—	10	—	12	—	15	ns

5670 tbl 16

NOTES:

1. Timing is the same for both ports.
2. These values are valid regardless of the power supply level selected for I/O and control signals (3.3V/2.5V). See page 5 for details.

Waveform of Interrupt Timing⁽¹⁾

5670 drw 18

5670 drw 19

NOTES:

1. All timing is the same for left and right ports. Port "A" may be either the left or right port. Port "B" is the port opposite from port "A".
2. Refer to Interrupt Truth Table.
3. $\overline{CE}_x = V_{IL}$ means $\overline{CE}_{0x} = V_{IL}$ and $CE_{1x} = V_{IH}$. $\overline{CE}_x = V_{IH}$ means $\overline{CE}_{0x} = V_{IH}$ and/or $CE_{1x} = V_{IL}$.
4. Timing depends on which enable signal (\overline{CE} or R/\overline{W}) is asserted last.
5. Timing depends on which enable signal (\overline{CE} or R/\overline{W}) is de-asserted first.

Truth Table III — Interrupt Flag^(1,4)

Left Port					Right Port					Function
R/ \overline{W} _L	\overline{CE} _L	\overline{OE} _L	A _{18L-A0L} ⁽⁵⁾	\overline{INT} _L	R/ \overline{W} _R	\overline{CE} _R	\overline{OE} _R	A _{18R-A0R} ⁽⁵⁾	\overline{INT} _R	
L	L	X	7FFFF	X	X	X	X	X	L ⁽²⁾	Set Right \overline{INT} _R Flag
X	X	X	X	X	X	L	L	7FFFF	H ⁽³⁾	Reset Right \overline{INT} _R Flag
X	X	X	X	L ⁽³⁾	L	L	X	7FFFE	X	Set Left \overline{INT} _L Flag
X	L	L	7FFFE	H ⁽²⁾	X	X	X	X	X	Reset Left \overline{INT} _L Flag

5670 tbl 17

NOTES:

1. Assumes $\overline{BUSY}_L = \overline{BUSY}_R = V_{IH}$. $\overline{CE}_x = L$ means $\overline{CE}_{0x} = V_{IL}$ and $CE_{1x} = V_{IH}$.
2. If $\overline{BUSY}_L = V_{IL}$, then no change.
3. If $\overline{BUSY}_R = V_{IL}$, then no change.
4. \overline{INT}_L and \overline{INT}_R must be initialized at power-up.
5. A_{18x} is a NC for IDT70T631. Therefore, Interrupt Addresses are 3FFFF and 3FFFE.

Truth Table IV —

X	H	MATCH	H	H	Normal
L	L	MATCH	(2)	(2)	Write Inhibit ⁽³⁾

5670 tbl 18

NOTES:

1. Pins \overline{BUSY}_L and \overline{BUSY}_R are both outputs when the part is configured as a master. Both are inputs when configured as a slave. \overline{BUSY} outputs on the IDT70T633/1 are push-pull, not open drain outputs. On slaves the \overline{BUSY} input internally inhibits writes.
2. "L" if the inputs to the opposite port were stable prior to the address and enable inputs of this port. "H" if the inputs to the opposite port became stable after the address and enable inputs of this port. If t_{APS} is not met, either \overline{BUSY}_L or $\overline{BUSY}_R = \text{LOW}$ will result. \overline{BUSY}_L and \overline{BUSY}_R outputs can not be LOW simultaneously.
3. Writes to the left port are internally ignored when \overline{BUSY}_L outputs are driving LOW regardless of actual logic level on the pin. Writes to the right port are internally ignored when \overline{BUSY}_R outputs are driving LOW regardless of actual logic level on the pin.
4. A₁₈ is a NC for IDT70T631. Address comparison will be for A₀ - A₁₇.
5. $\overline{CE}_X = \text{L}$ means $\overline{CE}_{0x} = V_{IL}$ and $CE_{1x} = V_{IH}$. $\overline{CE}_X = \text{H}$ means $\overline{CE}_{0x} = V_{IH}$ and/or $CE_{1x} = V_{IL}$.

Truth Table V — Example of Semaphore Procurement Sequence^(1,2,3)

Functions	D ₀ - D ₁₇ Left	D ₀ - D ₁₇ Right	Status
No Action	1	1	Semaphore free
Left Port Writes "0" to Semaphore	0	1	Left port has semaphore token
Right Port Writes "0" to Semaphore	0	1	No change. Right side has no write access to semaphore
Left Port Writes "1" to Semaphore	1	0	Right port obtains semaphore token
Left Port Writes "0" to Semaphore	1	0	No change. Left port has no write access to semaphore
Right Port Writes "1" to Semaphore	0	1	Left port obtains semaphore token
Left Port Writes "1" to Semaphore	1	1	Semaphore free
Right Port Writes "0" to Semaphore	1	0	Right port has semaphore token
Right Port Writes "1" to Semaphore	1	1	Semaphore free
Left Port Writes "0" to Semaphore	0	1	Left port has semaphore token
Left Port Writes "1" to Semaphore	1	1	Semaphore free

5670 tbl 19

NOTES:

1. This table denotes a sequence of events for only one of the eight semaphores on the IDT70T633/1.
2. There are eight semaphore flags written to via I/O₀ and read from all I/O's (I/O₀-I/O₁₇). These eight semaphores are addressed by A₀ - A₇.
3. $\overline{CE}_0 = V_{IH}$, $CE_1 = \overline{SEM} = V_{IL}$ to access the semaphores. Refer to the Semaphore Read/Write Control Truth Table.

Functional Description

The IDT70T633/1 provides two ports with separate control, address and I/O pins that permit independent access for reads or writes to any location in memory. The IDT70T633/1 has an automatic power down feature controlled by \overline{CE} . The \overline{CE}_0 and CE_1 control the on-chip power down circuitry that permits the respective port to go into a standby mode when not selected ($\overline{CE} = \text{HIGH}$). When a port is enabled, access to the entire memory array is permitted.

Interrupts

If the user chooses the interrupt function, a memory location (mail box or message center) is assigned to each port. The left port interrupt

flag (\overline{INT}_L) is asserted when the right port writes to memory location 7FFFE (HEX), where a write is defined as $\overline{CE}_R = R/\overline{W}_R = V_{IL}$ per the Truth Table. The left port clears the interrupt through access of address location 7FFFE when $\overline{CE}_L = \overline{OE}_L = V_{IL}$, R/\overline{W} is a "don't care". Likewise, the right port interrupt flag (\overline{INT}_R) is asserted when the left port writes to memory location 7FFFF (HEX) and to clear the interrupt flag (\overline{INT}_R), the right port must read the memory location 7FFFF. The message (18 bits) at 7FFFE or 7FFFF (3FFFF or 3FFFE for IDT70T631) is user-defined since it is an addressable SRAM location. If the interrupt function is not used, address locations 7FFFE and 7FFFF are not used as mail boxes, but as part of the random access memory. Refer to Truth Table III for the interrupt operation.

Busy Logic

Busy Logic provides a hardware indication that both ports of the RAM have accessed the same location at the same time. It also allows one of the two accesses to proceed and signals the other side that the RAM is "Busy". The $\overline{\text{BUSY}}$ pin can then be used to stall the access until the operation on the other side is completed. If a write operation has been attempted from the side that receives a $\overline{\text{BUSY}}$ indication, the write signal is gated internally to prevent the write from proceeding.

The use of $\overline{\text{BUSY}}$ logic is not required or desirable for all applications. In some cases it may be useful to logically OR the $\overline{\text{BUSY}}$ outputs together and use any $\overline{\text{BUSY}}$ indication as an interrupt source to flag the event of an illegal or illogical operation. If the write inhibit function of $\overline{\text{BUSY}}$ logic is not desirable, the $\overline{\text{BUSY}}$ logic can be disabled by placing the part in slave mode with the $\overline{\text{M/S}}$ pin. Once in slave mode the $\overline{\text{BUSY}}$ pin operates solely as a write inhibit input pin. Normal operation can be programmed by tying the $\overline{\text{BUSY}}$ pins HIGH. If desired, unintended write operations can be prevented to a port by tying the $\overline{\text{BUSY}}$ pin for that port LOW.

The $\overline{\text{BUSY}}$ outputs on the IDT70T633/1 RAM in master mode, are push-pull type outputs and do not require pull up resistors to operate. If these RAMs are being expanded in depth, then the $\overline{\text{BUSY}}$ indication for the resulting array requires the use of an external AND gate.

Figure 3. Busy and chip enable routing for both width and depth expansion with IDT70T633/1 Dual-Port RAMs.

Width Expansion with Busy Logic Master/Slave Arrays

When expanding an IDT70T633/1 RAM array in width while using $\overline{\text{BUSY}}$ logic, one master part is used to decide which side of the RAMs array will receive a $\overline{\text{BUSY}}$ indication, and to output that indication. Any number of slaves to be addressed in the same address range as the master use the $\overline{\text{BUSY}}$ signal as a write inhibit signal. Thus on the IDT70T633/1 RAM the $\overline{\text{BUSY}}$ pin is an output if the part is used as a master ($\overline{\text{M/S}}$ pin = V_{IH}), and the $\overline{\text{BUSY}}$ pin is an input if the part used as a slave ($\overline{\text{M/S}}$ pin = V_{IL}) as shown in Figure 3.

If two or more master parts were used when expanding in width, a split decision could result with one master indicating $\overline{\text{BUSY}}$ on one side of the array and another master indicating $\overline{\text{BUSY}}$ on one other side of the array. This would inhibit the write operations from one port for part of a word and inhibit the write operations from the other port for the other part of the word.

The $\overline{\text{BUSY}}$ arbitration on a master is based on the chip enable and

address signals only. It ignores whether an access is a read or write. In a master/slave array, both address and chip enable must be valid long enough for a $\overline{\text{BUSY}}$ flag to be output from the master before the actual write pulse can be initiated with the $\overline{\text{R/W}}$ signal. Failure to observe this timing can result in a glitched internal write inhibit signal and corrupted data in the slave.

Semaphores

The IDT70T633/1 is an extremely fast Dual-Port 512/256K x 18 CMOS Static RAM with an additional 8 address locations dedicated to binary semaphore flags. These flags allow either processor on the left or right side of the Dual-Port RAM to claim a privilege over the other processor for functions defined by the system designer's software. As an example, the semaphore can be used by one processor to inhibit the other from accessing a portion of the Dual-Port RAM or any other shared resource.

The Dual-Port RAM features a fast access time, with both ports being completely independent of each other. This means that the activity on the left port in no way slows the access time of the right port. Both ports are identical in function to standard CMOS Static RAM and can be read from or written to at the same time with the only possible conflict arising from the simultaneous writing of, or a simultaneous READ/WRITE of, a non-semaphore location. Semaphores are protected against such ambiguous situations and may be used by the system program to avoid any conflicts in the non-semaphore portion of the Dual-Port RAM. These devices have an automatic power-down feature controlled by $\overline{\text{CE0}}$ and $\overline{\text{CE1}}$, the Dual-Port RAM chip enables, and $\overline{\text{SEM}}$, the semaphore enable. The $\overline{\text{CE0}}$, $\overline{\text{CE1}}$, and $\overline{\text{SEM}}$ pins control on-chip power down circuitry that permits the respective port to go into standby mode when not selected.

Systems which can best use the IDT70T633/1 contain multiple processors or controllers and are typically very high-speed systems which are software controlled or software intensive. These systems can benefit from a performance increase offered by the hardware semaphores of the IDT70T633/1, which provide a lockout mechanism without requiring complex programming.

Software handshaking between processors offers the maximum in system flexibility by permitting shared resources to be allocated in varying configurations. The IDT70T633/1 does not use its semaphore flags to control any resources through hardware, thus allowing the system designer total flexibility in system architecture.

An advantage of using semaphores rather than the more common methods of hardware arbitration is that wait states are never incurred in either processor. This can prove to be a major advantage in very high-speed systems.

How the Semaphore Flags Work

The semaphore logic is a set of eight latches which are independent of the Dual-Port RAM. These latches can be used to pass a flag, or token, from one port to the other to indicate that a shared resource is in use. The semaphores provide a hardware assist for a use assignment method called "Token Passing Allocation." In this method, the state of a semaphore latch is used as a token indicating that a shared resource is in use. If the left processor wants to use this resource, it requests the token by setting the latch. This processor then

verifies its success in setting the latch by reading it. If it was successful, it proceeds to assume control over the shared resource. If it was not successful in setting the latch, it determines that the right side processor has set the latch first, has the token and is using the shared resource. The left processor can then either repeatedly request that semaphore's status or remove its request for that semaphore to perform another task and occasionally attempt again to gain control of the token via the set and test sequence. Once the right side has relinquished the token, the left side should succeed in gaining control.

The semaphore flags are active LOW. A token is requested by writing a zero into a semaphore latch and is released when the same side writes a one to that latch.

The eight semaphore flags reside within the IDT70T633/1 in a separate memory space from the Dual-Port RAM array. This address space is accessed by placing a low input on the SEM pin (which acts as a chip select for the semaphore flags) and using the other control pins (Address, CE0, CE1, R/W and LB/UB) as they would be used in accessing a standard Static RAM. Each of the flags has a unique address which can be accessed by either side through address pins A0 – A2. When accessing the semaphores, none of the other address pins has any effect.

When writing to a semaphore, only data pin Do is used. If a low level is written into an unused semaphore location, that flag will be set to a zero on that side and a one on the other side (see Truth Table V). That semaphore can now only be modified by the side showing the zero. When a one is written into the same location from the same side, the flag will be set to a one for both sides (unless a semaphore request from the other side is pending) and then can be written to by both sides. The fact that the side which is able to write a zero into a semaphore subsequently locks out writes from the other side is what makes semaphore flags useful in interprocessor communications. (A thorough discussion on the use of this feature follows shortly.) A zero written into the same location from the other side will be stored in the semaphore request latch for that side until the semaphore is freed by the first side.

When a semaphore flag is read, its value is spread into all data bits so that a flag that is a one reads as a one in all data bits and a flag containing a zero reads as all zeros for a semaphore read, the SEM, BEn, and OE signals need to be active. (Please refer to Truth Table II). Furthermore, the read value is latched into one side's output register when that side's semaphore select (SEM, BEn) and output enable (OE) signals go active. This serves to disallow the semaphore from changing state in the middle of a read cycle due to a write cycle from the other side.

A sequence WRITE/READ must be used by the semaphore in order to guarantee that no system level contention will occur. A processor requests access to shared resources by attempting to write a zero into a semaphore location. If the semaphore is already in use, the semaphore request latch will contain a zero, yet the semaphore flag will appear as one, a fact which the processor will verify by the subsequent read (see Table V). As an example, assume a processor writes a zero to the left port at a free semaphore location. On a subsequent read, the processor will verify that it has written successfully to that location and will assume control over the resource in question. Meanwhile, if a processor on the right side attempts to write

a zero to the same semaphore flag it will fail, as will be verified by the fact that a one will be read from that semaphore on the right side during subsequent read. Had a sequence of READ/WRITE been used instead, system contention problems could have occurred during the gap between the read and write cycles.

It is important to note that a failed semaphore request must be followed by either repeated reads or by writing a one into the same location. The reason for this is easily understood by looking at the simple logic diagram of the semaphore flag in Figure 4. Two semaphore request latches feed into a semaphore flag. Whichever latch is first to present a zero to the semaphore flag will force its side of the semaphore flag LOW and the opposite side HIGH. This condition will continue until a one is written to the same semaphore request latch.

Figure 4. IDT70T633/1 Semaphore Logic 5670 drw 21

If the opposite side semaphore request latch has been written to zero in the meantime, the semaphore flag will flip over to the other side as soon as a one is written into the first request latch. The opposite side flag will now stay LOW until its semaphore request latch is written to a one. From this it is easy to understand that, if a semaphore is requested and the processor which requested it no longer needs the resource, the entire system can hang up until a one is written into that semaphore request latch.

The critical case of semaphore timing is when both sides request a single token by attempting to write a zero into it at the same time. The semaphore logic is specially designed to resolve this problem. If simultaneous requests are made, the logic guarantees that only one side receives the token. If one side is earlier than the other in making the request, the first side to make the request will receive the token. If both requests arrive at the same time, the assignment will be arbitrarily made to one port or the other.

One caution that should be noted when using semaphores is that semaphores alone do not guarantee that access to a resource is secure. As with any powerful programming technique, if semaphores are misused or misinterpreted, a software error can easily happen.

Initialization of the semaphores is not automatic and must be handled via the initialization program at power-up. Since any semaphore request flag which contains a zero must be reset to a one, all semaphores on both sides should have a one written into them at initialization from both sides to assure that they will be free when needed.

Timing Waveform of Sleep Mode^(1,2)

5670 drw.22

- NOTES:
1. $C\bar{E}_1 = V_{IH}$.
 2. All limiting is same for Left and Right ports.

Sleep Mode

The IDT70T633/1 is equipped with an optional sleep or low power mode on both ports. The sleep mode pin on both ports is active high. During normal operation, the ZZ pin is pulled low. When ZZ is pulled high, the port will enter sleep mode where it will have the lowest possible power consumption. The sleep mode timing diagram demonstrates the modes of operation: Normal Operation, No Read/Write Allowed and Sleep Mode.

For a period of time prior to sleep mode and after recovering from sleep

mode (t_{zzs} and t_{zsr}), new reads or writes are not allowed. If a write or read operation occurs during these periods, the memory array may be corrupted. Validity of data out from the RAM cannot be guaranteed immediately after ZZ is asserted (prior to being in sleep).

During sleep mode the RAM automatically deselects itself and disconnects its internal buffer. All outputs will remain in high-Z state while in sleep mode. All inputs are allowed to toggle, but the RAM will not be selected and will not perform any reads or writes.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
