

**Features**

- ◆ True Dual-Ported memory cells which allow simultaneous access of the same memory location
- ◆ High-speed clock to data access
  - Commercial: 7.5/9/12ns (max.)
  - Industrial: 9ns (max.)
- ◆ Low-power operation
  - IDT70T9169/59L
  - Active: 225mW (typ.)
  - Standby: 1.5mW (typ.)
- ◆ Flow-Through or Pipelined output mode on either Port via the FT/PIPE pins
- ◆ Counter enable and reset features
- ◆ Dual chip enables allow for depth expansion without additional logic
- ◆ Full synchronous operation on both ports
  - 4.0ns setup to clock and 0.5ns hold on all control, data, and address inputs
  - Data input, address, and control registers
  - Fast 7.5ns clock to data out in the Pipelined output mode
  - Self-timed write allows fast cycle time
  - 12ns cycle time, 83MHz operation in Pipelined output mode
- ◆ LVTTTL-compatible, single 2.5V ( $\pm 100\text{mV}$ ) power supply
- ◆ Industrial temperature range ( $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ ) is available for 66MHz
- ◆ Available in a 100-pin Thin Quad Flatpack (TQFP) and 100-pin fine pitch Ball Grid Array (fpBGA) packages

## Description

The IDT70T9169/59 is a high-speed 16/8K x 9 bit synchronous Dual-Port RAM. The memory array utilizes Dual-Port memory cells to allow simultaneous access of any address from both ports. Registers on control, data, and address inputs provide minimal setup and hold times. The timing latitude provided by this approach allows systems to be designed with very short cycle times.

With an input data register, the IDT70T9169/59 has been optimized for applications having unidirectional or bidirectional data flow in bursts. An automatic power down feature, controlled by  $\overline{CE0}$  and  $CE1$ , permits the on-chip circuitry of each port to enter a very low standby power mode. Fabricated using IDT's CMOS high-performance technology, these devices typically operate on only 225mW of power.

## NOTES:

- At  $f = f_{MAX}$ , address and control lines (except Output Enable) are cycling at the maximum frequency clock cycle of  $1/t_{cyc}$ , using "AC TEST CONDITIONS" at input levels of GND to 2.5V.
- $f = 0$  means no address, clock, or control lines change. Applies only to input at CMOS level standby.
- Port "A" may be either left or right port. Port "B" is the opposite to port "A".
- $V_{DD} = 2.5V, T_A = 25^\circ C$  for Typ, and are not production tested.  $I_{DD DC}(f=0) = 75mA$  (Typ).
- $\overline{CE}_X = V_{IL}$  means  $\overline{CE}_{0X} = V_{IL}$  and  $CE_{1X} = V_{IH}$   
 $\overline{CE}_X = V_{IH}$  means  $\overline{CE}_{0X} = V_{IH}$  or  $CE_{1X} = V_{IL}$   
 $\overline{CE}_X \leq 0.2V$  means  $\overline{CE}_{0X} \leq 0.2V$  and  $CE_{1X} \geq V_{DD} - 0.2V$   
 $\overline{CE}_X \geq V_{DD} - 0.2V$  means  $\overline{CE}_{0X} \geq V_{DD} - 0.2V$  or  $CE_{1X} \leq 0.2V$   
 "X" represents "L" for left port or "R" for right port.

**NOTES:**

- Transition is measured 0mV from Low or High-impedance voltage with the Output Test Load (Figure 2). This parameter is guaranteed by device characterization, but is not production tested.
- The Pipelined output parameters (t<sub>CYC2</sub>, t<sub>CD2</sub>) to either the Left or Right ports when  $\overline{FT}/PIPE = V_{IH}$ . Flow-Through parameters (t<sub>CYC1</sub>, t<sub>CD1</sub>) apply when  $\overline{FT}/PIPE = V_{IL}$  for that port.
- All input signals are synchronous with respect to the clock except for the asynchronous Output Enable ( $\overline{OE}$ ),  $\overline{FT}/PIPE_R$  and  $\overline{FT}/PIPE_L$ .

3. The "Internal Address" is equal to the "External Address" when  $\overline{ADS} = V_{IL}$  and equals the counter output when  $\overline{ADS} = V_{IH}$ .

4. Addresses do not have to be accessed sequentially since  $\overline{ADS} = V_{IL}$  constantly loads the address on the rising edge of the CLK; numbers are for reference use only.

5. Output state (High, Low, or High-impedance) is determined by the previous cycle control signals.

6. No dead cycle exists during counter reset. A READ or WRITE cycle may be coincidental with the counter reset cycle.

7.  $\overline{CNTEN} = V_{IL}$  advances Internal Address from 'An' to 'An + 1'. The transition shown indicates the time required for the counter to advance. The 'An + 1' Address is written to during this cycle.

## A Functional Description

The IDT70T9169/59 provides a true synchronous Dual-Port Static RAM interface. Registered inputs provide minimal set-up and hold times on address, data, and all critical control inputs. All internal registers are clocked on the rising edge of the clock signal, however, the self-timed internal write pulse is independent of the LOW to HIGH transition of the clock signal.

An asynchronous output enable is provided to ease asynchronous bus interfacing. Counter enable inputs are also provided to stall the operation of the address counters for fast interleaved memory applications.

$\overline{CE}_0 = V_{IH}$  or  $CE_1 = V_{IL}$  for one clock cycle will power down the internal circuitry to reduce static power consumption. Multiple chip enables allow easier banking of multiple IDT70T9169/59's for depth expansion configurations. When the Pipelined output mode is enabled, two cycles are required to get valid data on the outputs.

## Depth and Width Expansion

The IDT70T9169/59 features dual chip enables (refer to Truth Table 1) in order to facilitate rapid and simple depth expansion with no requirements for external logic. Figure 4 illustrates how to control the various chip enables in order to expand two devices in depth.

The IDT70T9169/59 can also be used in applications requiring expanded width, as indicated in Figure 4. Since the banks are allocated at the discretion of the user, the external controller can be set up to drive the input signals for the various devices as required to allow for 18-bit or wider applications.
