

**BiCMOS Static RAM  
240K (16K x 15-Bit)  
Cache-Tag RAM  
for the Pentium™ Processor**

**IDT71215**

**Features**

- ◆ 16K x 15 Configuration
  - 12 TAG Bits
  - 3 Separate I/O Status Bits (Valid, Dirty, Write Through)
- ◆ Match output uses Valid bit to qualify MATCH output
- ◆ High-Speed Address-to-Match comparison times
  - 8/9/10/12ns over commercial temperature range
- ◆ BRDY circuitry included inside the Cache-Tag for highest speed operation
- ◆ Asynchronous Read/Match operation with Synchronous Write and Reset operation
- ◆ Separate WE for the TAG bits and the Status bits
- ◆ Separate OE for the TAG bits, the Status bits, and BRDY
- ◆ Synchronous RESET pin for invalidation of all Tag entries
- ◆ Dual Chip selects for easy depth expansion with no performance degradation
- ◆ I/O pins both 5V TTL and 3.3V LVTTTL compatible with VCCO pins
- ◆ PWRDN pin to place device in low-power mode
- ◆ Packaged in a 80-pin Thin Plastic Quad Flat Pack (TQFP).

**Description**

The IDT71215 is a 245,760-bit Cache Tag Static RAM, organized 16K x 15 and designed to support the Pentium and other Intel processors at bus speeds up to 66MHz. There are twelve common I/O TAG bits, with the remaining three bits used as status bits. A 12-bit comparator is on-chip to allow fast comparison of the twelve

stored TAG bits and the current Tag input data. An active HIGH MATCH output is generated when these two groups of data are the same for a given address. This high-speed MATCH signal, with tADM as fast as 8ns, provides the fastest possible enabling of secondary cache accesses.

The three separate I/O status bits (VLD, DTY, and WT) can be configured for either dedicated or generic functionality, depending on the SFUNC input pin. With SFUNC LOW, the status bits are defined and used internally by the device, allowing easier determination of the validity and use of the given Tag data. SFUNC HIGH releases the defined internal status bit usage and control, allowing the user to configure the status bit information to fit his system needs. A synchronous RESET pin, when held LOW at a rising clock edge, will reset all status bits in the array for easy invalidation of all Tag addresses.

The IDT71215 also provides the option for Burst Ready (BRDY) generation within the cache tag itself, based upon MATCH, VLD bit, WT bit, and external inputs provided by the user. This can significantly simplify cache controller logic and minimize cache decision time. Match and Read operations are both asynchronous in order to provide the fastest access times possible, while Write operations are synchronous for ease of system timing.

The IDT71215 uses a 5V power supply on VCC with separate VCCO pins provided for the outputs to offer compliance with both 5V TTL and 3.3V LVTTTL Logic levels. The PWRDN pin offers a low-power standby mode to reduce power consumption by 90%, providing significant system power savings.

The IDT71215 is fabricated using IDT's high-performance, high-reliability BiCMOS technology and is offered in a space-saving 80-pin Thin Plastic Quad Flat Pack (TQFP) package.

**NOTES:**

- "H" = V<sub>IH</sub>, "L" = V<sub>IL</sub>, "X" = don't care, "-" = unrelated.
- This table applies when  $\overline{CS1}$  is LOW and CS2,  $\overline{RESET}$ , and  $\overline{PWRDN}$  are HIGH.  $\overline{BRDYO\overline{E}}$ ,  $\overline{BRDYH}$ ,  $\overline{BRDYIN}$  and SFUNC are "X" for this table.
- Dout in this case is the same as Din; that is, the input data is written through to the outputs during the write operation.

**NOTES:**

- "H" = V<sub>IH</sub>, "L" = V<sub>IL</sub>, "X" = don't care, "-" = unrelated.
- M = HIGH if TAGIN equals the memory contents at that address; M = LOW if TAGIN does not equal the memory contents at that address.
- PWRDN and RESET are HIGH for this table. W/R, BRDYH, BRDYOE, BRDYIN, OES, and CLK are "X".
- This column represents the stored memory cell data for the given Status bit at the selected address.

3075 tbl 05

**NOTES:**

- "H" = V<sub>IH</sub>, "L" = V<sub>IL</sub>, "X" = don't care, "-" = unrelated.
- M = HIGH if TAGIN equals the memory contents at that address; M = LOW if TAGIN does not equal the memory contents at that address.
- PWRDN and RESET are HIGH for this table. CLK and OES are "X".
- This column represents the stored memory cell data for the given Status bit at the selected address.
- CS1 is LOW, CS2 is HIGH for this table.
- BRDYIN is a synchronous input; thus the inputs noted in the table must be applied during a rising CLK edge.
- BRDYIN will be a factor in determining the BRDY output in all cases except when BRDYH is HIGH and there is a valid MATCH. In that case, BRDY will be LOW(Valid).

NOTES: 3075 tbl 08  
1. Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.  
2. V<sub>IN</sub> should not exceed V<sub>CC</sub>+0.5V. All pins should not exceed 7.0V. V<sub>CCQ</sub> should never exceed V<sub>CC</sub>, and V<sub>CC</sub> should never exceed V<sub>CCQ</sub> + 4.0V.

### NOTES:

1. This parameter is guaranteed with the AC Load (Figure 3) by device characterization, but is not production tested.
2. These parameters only apply when SFUNC is LOW and the internal WT bit is HIGH.
3. tADM, tDAM, tCSM and tADB, tDAB, tCSB must also be satisfied.

## AC Test Conditions

Input Pulse Levels	GND to 3.0V
Input Rise/Fall Times	3ns
Input Timing Reference Levels	1.5V
Output Timing Reference Levels	1.5V

## Timing Waveforms of Write and Read Cycles

3075 dhw 07

**NOTE:**  
 1. Transition is measured  $\pm 200\text{mV}$  from steady state.

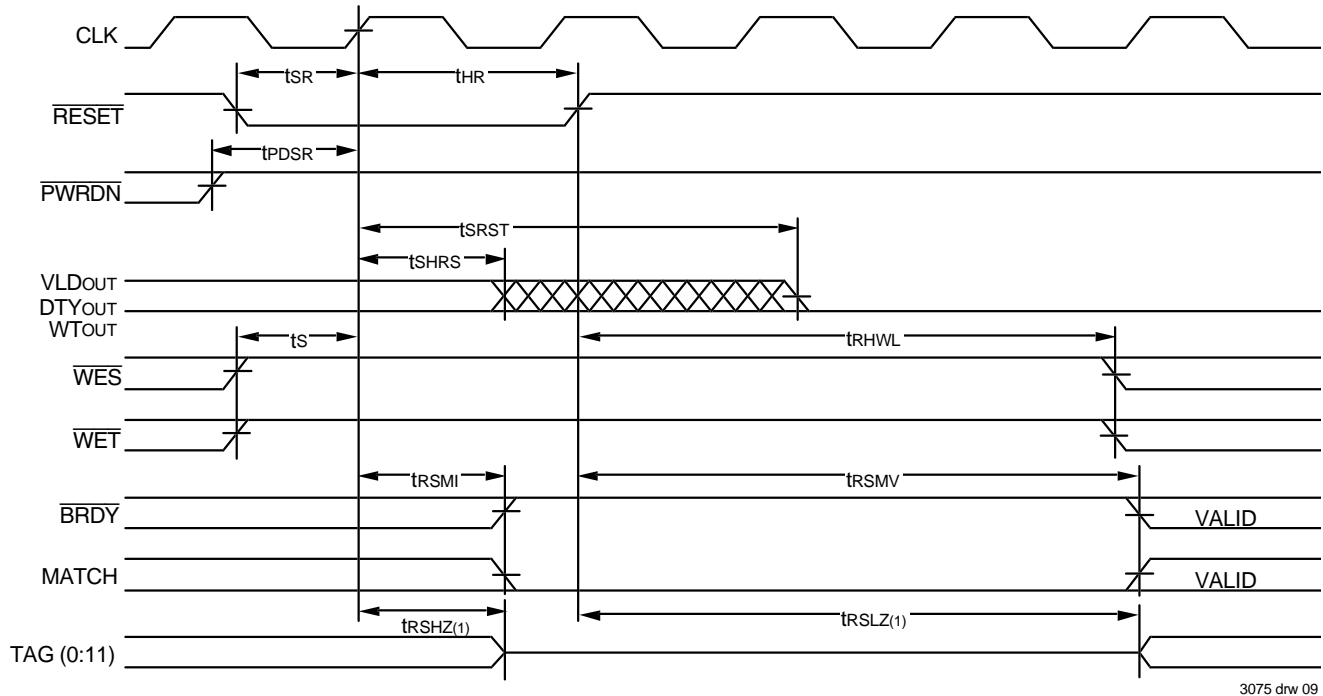

## Timing Waveforms of Match and BRDY Functions

3075 dnv 08

**NOTE:**  
 1. Transition is measured  $\pm 200\text{mV}$  from steady state.

## Timing Waveforms of $\overline{\text{RESET}}$ Function
