

Features

- ◆ **RC32300 32-bit Microprocessor**
 - Up to 150 MHz operation
 - Enhanced MIPS-II Instruction Set Architecture (ISA)
 - Cache prefetch instruction
 - Conditional move instruction
 - DSP instructions
 - Supports big or little endian operation
 - MMU with 32 page TLB
 - 8kB Instruction Cache, 2-way set associative
 - 2kB Data Cache, 2-way set associative
 - Cache locking per line
 - Programmable on a page basis to implement a write-through no write allocate, write-through write allocate, or write-back algorithms for cache management
 - Compatible with a wide variety of operating systems
- ◆ **Local Bus Interface**
 - Up to 75 MHz operation
 - 26-bit address bus
 - 32-bit data bus
 - Direct control of local memory and peripherals
 - Programmable system watch-dog timers
 - Big or little endian support
- ◆ **Interrupt Controller simplifies exception management**
- ◆ **Four general purpose 32-bit timer/counters**

- ◆ **Programmable I/O (PIO)**
 - Input/Output/Interrupt source
 - Individually programmable
- ◆ **SDRAM Controller (32-bit memory only)**
 - 4 banks, non-interleaved
 - Up to 512MB total SDRAM memory supported
 - Implements full, direct control of discrete, SODIMM, or DIMM memories
 - Supports 16Mb through 512Mb SDRAM device depths
 - Automatic refresh generation
- ◆ **Serial Peripheral Interface (SPI) master mode interface**
- ◆ **UART Interface**
 - Two 16550 compatible UARTs
 - Baud rate support up to 1.5 Mb/s
 - Modem control signals available on one channel
- ◆ **Memory & Peripheral Controller**
 - 6 banks, up to 64MB per bank
 - Supports 8-, 16-, and 32-bit interfaces
 - Supports Flash ROM, SRAM, dual-port memory, and peripheral devices
 - Supports external wait-state generation
 - 8-bit boot PROM support
 - Flexible I/O timing protocols

Block Diagram

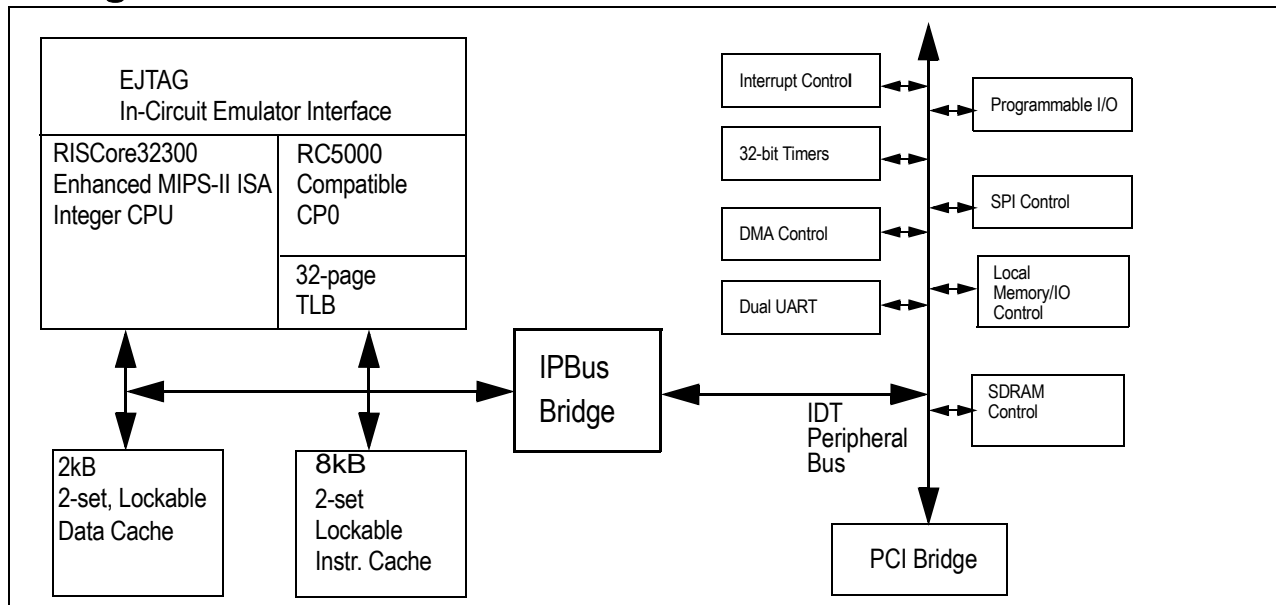

Figure 1 RC32334 Block Diagram

Note: This data sheet does not apply to revision Z silicon. Contact your IDT sales representative for information on revision Z.

- ◆ **4 DMA Channels**
 - 4 general purpose DMA, each with endianness swappers and byte lane data alignment
 - Supports scatter/gather, chaining via linked lists of records
 - Supports memory-to-memory, memory-to-I/O, memory-to-PCI, PCI-to-PCI, and I/O-to-I/O transfers
 - Supports unaligned transfers
 - Supports burst transfers
 - Programmable DMA bus transactions burst size (up to 16 bytes)
- ◆ **PCI Bus Interface**
 - 32-bit PCI, up to 66 MHz
 - Revision 2.2 compatible
 - Target or master
 - Host or satellite
 - Three slot PCI arbiter
 - Serial EEPROM support, for loading configuration registers
- ◆ **Off-the-shelf development tools**
- ◆ **JTAG Interface (IEEE Std. 1149.1 compatible)**
- ◆ **256-ball BGA (1.0mm spacing)**
- ◆ **3.3V operation with 5V tolerant I/O**
- ◆ **EJTAG in-circuit emulator interface**

Device Overview

The IDT RC32334 device is an integrated processor based on the RC32300 CPU core. This product incorporates a high-performance, low-cost 32-bit CPU core with functionality common to a large number of embedded applications. The RC32334 integrates these functions to enable the use of low-cost PC commodity market memory and I/O devices, allowing the aggressive price/performance characteristics of the CPU to be realized quickly into low-cost systems.

CPU Execution Core

The RC32334 integrates the RISCORE32300, the same CPU core found in the award-winning RC32364 microprocessor.

The RISCORE32300 implements the Enhanced MIPS-II ISA. Thus, it is upwardly compatible with applications written for a wide variety of MIPS architecture processors, and it is kernel compatible with the modern operating systems that support IDT's 64-bit RISCController product family.

The RISCORE32300 was explicitly defined and designed for integrated processor products such as the RC32334. Key attributes of the execution core found within this product include:

- ◆ High-speed, 5-stage scalar pipeline executes to 150MHz. This high performance enables the RC32334 to perform a variety of performance intensive tasks, such as routing, DSP algorithms, etc.
- ◆ 32-bit architecture with enhancements of key capabilities. Thus, the RC32334 can execute existing 32-bit programs, while enabling designers to take advantage of recent advances in CPU architecture.
- ◆ Count leading-zeroes/ones. These instructions are common to a wide variety of tasks, including modem emulation, voice over IP compression and decompression, etc.
- ◆ Cache PREFetch instruction support, including a specialized form intended to help memory coherency. System programmers can allocate and stage the use of memory bandwidth to achieve maximum performance.
- ◆ 8kB of 2-way set associative instruction cache

Figure 2 RC32334 Based System Diagram

- ◆ 2KB of 2-way set associative data cache, capable of write-back and write-through operation.
- ◆ Cache locking per line to speed real-time systems and critical system functions
- ◆ On-chip TLB to enable multi-tasking in modern operating systems
- ◆ EJTAG interface to enable sophisticated low-cost in-circuit emulation.

Synchronous-DRAM Interface

The RC32334 integrates a SDRAM controller which provides direct control of system SyncDRAM running at speeds to 75MHz.

Key capabilities of the SDRAM controller include:

- ◆ Direct control of 4 banks of SDRAM (up to 2 64-bit wide DIMMs)
- ◆ On-chip page comparators optimize access latency.
- ◆ Speeds to 75MHz
- ◆ Programmable address map.
- ◆ Supports 16, 64, 128, 256, or 512Mb SDRAM devices
- ◆ Automatic refresh generation driven by on-chip timer
- ◆ Support for discrete devices, SODIMM, or DIMM modules.

Thus, systems can take advantage of the full range of commodity memory that is available, enabling system optimization for cost, real-estate, or other attributes.

Local Memory and I/O Controller

The local memory and I/O controller implements direct control of external memory devices, including the boot ROM as well as other memory areas, and also implements direct control of external peripherals.

The local memory controller is highly flexible, allowing a wide range of devices to be directly controlled by the RC32334 processor. For example, a system can be built using an 8-bit boot ROM, 16-bit FLASH cards (possibly on PCMCIA), a 32-bit SRAM or dual-port memory, and a variety of low-cost peripherals.

Key capabilities include:

- ◆ Direct control of EPROM, FLASH, RAM, and dual-port memories
- ◆ 6 chip-select outputs, supporting up to 64MB per memory space
- ◆ Supports mixture of 8-, 16-, and 32-bit wide memory regions
- ◆ Flexible timing protocols allow direct control of a wide variety of devices
- ◆ Programmable address map for 2 chip selects
- ◆ Automatic wait state generation.

PCI Bus Bridge

In order to leverage the wide availability of low-cost peripherals for the PC market as well as to simplify the design of add-in functions, the RC32334 integrates a full 32-bit PCI bus bridge. Key attributes of this bridge include:

- ◆ 66 MHz operation
- ◆ PCI revision 2.2 compliant
- ◆ Programmable address mappings between CPU/Local memory and PCI memory and I/O
- ◆ On-chip PCI arbiter
- ◆ Extensive buffering allows PCI to operate concurrently with local memory transfers
- ◆ Selectable byte-ordering swapper
- ◆ 5V tolerant I/O.

On-Chip DMA Controller

To minimize CPU exception handling and maximize the efficiency of system bandwidth, the RC32334 integrates a very sophisticated 4-channel DMA controller on chip.

The RC32334 DMA controller is capable of:

- ◆ Chaining and scatter/gather support through the use of a flexible, linked list of DMA transaction descriptors
- ◆ Capable of memory<->memory, memory<->I/O, and PCI<->memory DMA
- ◆ Unaligned transfer support
- ◆ Byte, halfword, word, quadword DMA support.

On-Chip Peripherals

The RC32334 also integrates peripherals that are common to a wide variety of embedded systems.

- ◆ Dual channel 16550 compatible UARTs, with modem control interface on one channel.
- ◆ SPI master mode interface for direct interface to EEPROM, A/D, etc.
- ◆ Interrupt Controller to speed interrupt decode and management
- ◆ Four 32-bit on-chip Timer/Counters
- ◆ Programmable I/O module

Debug Support

To facilitate rapid time to market, the RC32334 provides extensive support for system debug.

First and foremost, this product integrates an EJTAG in-circuit emulation module, allowing a low-cost emulator to interoperate with programs executing on the controller. By using an augmented JTAG interface, the RC32334 is able to reuse the same low-cost emulators developed around the RC32364 CPU.

Secondly, the RC32334 implements additional reporting signals intended to simplify the task of system debugging when using a logic analyzer. This product allows the logic analyzer to differentiate transactions initiated by DMA from those initiated by the CPU and further allows CPU transactions to be sorted into instruction fetches vs. data fetches.

Finally, the RC32334 implements a full boundary scan capability, allowing board manufacturing diagnostics and debug.

Packaging

The RC32334 is packaged using a 256-lead PBGA package, with 1.0mm ball spacing.

Thermal Considerations

The RC32334 consumes less than 2.1 W peak power. The device is guaranteed in an ambient temperature range of 0° to +70° C for commercial temperature devices; -40° to +85° for industrial temperature devices.

Revision History

May 16, 2000: Initial version.

June 8, 2000: In CPU Core Specific Signals section of Table 1, changed `cpu_dr_r_n` pin from Input to Output. Updated document from Advance to Preliminary Information.

June 15, 2000: In Table 1, switched assertion and de-assertion for `debug_cpu_dma_n` signal. In the AC Timing Characteristics table, added SPI section and adjusted parameters in the Reset section.

July 12, 2000: Removed "Preliminary Information" statement. Added information regarding external pull-ups and pull-downs to the Pin Description Table. Made minor revisions in other parts of the data sheet.

August 3, 2000: Added Pin Layout diagram showing power and ground pins. Revised Power Curves section to reflect support of only 2x, 3x, and 4x.

August 30, 2000: Added Standby mode and values to Power Consumption table. Extended Power Curve figure to 75 MHz.

September 25, 2000: Changed MIPS32 ISA to Enhanced MIPS-II. In Local System Interface section of Table 6, changed Thld2 values for `mem_data[31:0]` from 1.8 to 1.5 ns and changed Tdoh3 values for `mem_addr[25:2]`, etc. from 1.8 to 1.5 ns.

December 12, 2000: Changed Max values for `cpu_masterclock` period in Table 5 and added footnote. In Table 1, added 2nd alternate function for `spi_mosi`, `spi_miso`, `spi_sck`. In Table 10, removed the "1" from Alt column for `cpu_masterclk` and added "2" in Alt column for pins G3, G4, H2. In RC32334 Alternate Signal Functions table: added pin T2; added pin names in Alt #2 column for pins G3, G4, H2; added PIO[11] to Alt #2 column for pin R3.

January 4, 2001: In Table 6 under Interrupt Handling, moved the values for Tsu9 from the Max to the Min columns.

March 13, 2001: Changed upper ambient temperature for industrial and commercial uses from +70° C to +85° C.

June 7, 2001: In the Clock Parameters table, added footnote 3 to `output_clk` category and added NA to Min and Max columns. In Figure 3 (Reset Specification), enhanced signal line for `cpu_masterclk`. In Local System Interface section of AC Timing Characteristics table, changed values in Min column for last category of signals (Tdoh3) from 1.5 to 2.5 for all speeds. In SDRAM Controller section of same table, changed values in Min column for last category of signals (9 signals) from 1 to 2.5 for all speeds.

September 14, 2001: In the Reset category of Table 6: switched `mem_addr[19:17]` from Tsu22 and Thld22 to Tsu10 and Thld10; switched `mem_addr[22:20]` from Tsu10 and Thld10 to Tsu22 and Thld22; moved `eitag_pcst[2:0]` from Reset to Debug Interface category under Tsu20 and Thld20.

November 1, 2001: Added Input Voltage Undershoot parameter and 2 footnotes to Table 10.

March 20, 2002: In Local System Interface section of AC Timing Characteristics table, changed values in Min column for last category of signals (Tdoh3) from 2.5 to 1.5 for all speeds. In Table 8, PCI Drive Output Pads, the Conditions for parameters V_{OL} , V_{OH} , V_{IL} , and V_{IH} were changed to read Per PCI 2.2.

May 2, 2002: Changed upper ambient temperature for commercial uses back from +85° C to +70° C (changed erroneously from 70 to 85 on March 13, 2001). Added Reset State Status column to Table 1. Revised description of `jtag_trst_n` in Table 1 and changed this pin to a pull-down instead of a pull-up.

July 3, 2002: This data sheet now describes revision Y silicon and is no longer applicable to revision Z.

July 12, 2002: In Table 6: PCI section, changed Thld Min values from 1 to zero; DMA section, changed Thld9 Min values from 2 to 1; in PIO section, changed Thld9 Min values from 2 to 1; in Timer section, changed Thld10 Min values from 2 to 1. Revision Y data sheet changed from Preliminary to Final.

September 18, 2002: Added `cpu_coldreset_n` rise time to Table 5, Clock Parameters. Added `mem_addr[16]` and `sdram_addr[16]` to Tables 1 and 12. Changed Logic Diagram to include `sdram_addr[16]`.

December 18, 2002: In the Reset section of Table 6, AC Timing Characteristics, setup and hold time categories for `cpu_coldreset_n` have been deleted.

July 30, 2003: In Table 8, added 3 new categories (Input Pads, PCI Input Pads, and All Pads) and added footnotes 2 and 3.

March 24, 2004: In Table 1, changed description in Satellite Mode for `pci_rst_n`. Specified "cold" reset on pages 11 and 12. Changed the maximum value for Vcc to 4.0 in Table 10, Absolute Maximum Ratings, and changed footnote 1 to that table. Added Power Ramp-up section on page 21.

August 31, 2004: Added "Green" orderable parts on page 30.

Pin Description Table

The following table lists the pins provided on the RC32334. Note that those pin names followed by "_n" are active-low signals. All external pull-ups and pull-downs require 10 kΩ resistor.

Name	Type	Reset State Status	Drive Strength Capability	Description																									
Local System Interface																													
mem_data[31:0]	I/O	Z	High	Local System Data Bus Primary data bus for memory. I/O and SDRAM.																									
mem_addr[25:2]	I/O	[25:10] Z [9:2] L	[25:17] Low [16:2] High	<p>Memory Address Bus These signals provide the Memory or DRAM address, during a Memory or DRAM bus transaction. During each word data, the address increments either in linear or sub-block ordering, depending on the transaction type. The table below indicates how the memory write enable signals are used to address discreet memory port width types.</p> <table border="1"> <thead> <tr> <th>Port Width</th> <th>Pin Signals mem_we_n[3]</th> <th>mem_we_n[2]</th> <th>mem_we_n[1]</th> <th>mem_we_n[0]</th> </tr> </thead> <tbody> <tr> <td>DMA (32-bit)</td> <td>mem_we_n[3]</td> <td>mem_we_n[2]</td> <td>mem_we_n[1]</td> <td>mem_we_n[0]</td> </tr> <tr> <td>32-bit</td> <td>mem_we_n[3]</td> <td>mem_we_n[2]</td> <td>mem_we_n[1]</td> <td>mem_we_n[0]</td> </tr> <tr> <td>16-bit</td> <td>Byte High Write Enable</td> <td>mem_addr[1]</td> <td>Not Used (Driven Low)</td> <td>Byte Low Write Enable</td> </tr> <tr> <td>8-bit</td> <td>Not Used (Driven High)</td> <td>mem_addr[1]</td> <td>mem_addr[0]</td> <td>Byte Write Enable</td> </tr> </tbody> </table> <p>mem_addr[22] Alternate function: reset_boot_mode[1]. mem_addr[21] Alternate function: reset_boot_mode[0]. mem_addr[20] Alternate function: reset_pci_host_mode. mem_addr[19] Alternate function: modebit [9]. mem_addr[18] Alternate function: modebit [8]. mem_addr[17] Alternate function: modebit [7]. mem_addr[16] Alternate function: sdram_addr[16]. mem_addr[15] Alternate function: sdram_addr[15]. mem_addr[14] Alternate function: sdram_addr[14]. mem_addr[13] Alternate function: sdram_addr[13]. mem_addr[11] Alternate function: sdram_addr[11]. mem_addr[10] Alternate function: sdram_addr[10]. mem_addr[9] Alternate function: sdram_addr[9]. mem_addr[8] Alternate function: sdram_addr[8]. mem_addr[7] Alternate function: sdram_addr[7]. mem_addr[6] Alternate function: sdram_addr[6]. mem_addr[5] Alternate function: sdram_addr[5]. mem_addr[4] Alternate function: sdram_addr[4]. mem_addr[3] Alternate function: sdram_addr[3]. mem_addr[2] Alternate function: sdram_addr[2].</p>	Port Width	Pin Signals mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]	DMA (32-bit)	mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]	32-bit	mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]	16-bit	Byte High Write Enable	mem_addr[1]	Not Used (Driven Low)	Byte Low Write Enable	8-bit	Not Used (Driven High)	mem_addr[1]	mem_addr[0]	Byte Write Enable
Port Width	Pin Signals mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]																									
DMA (32-bit)	mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]																									
32-bit	mem_we_n[3]	mem_we_n[2]	mem_we_n[1]	mem_we_n[0]																									
16-bit	Byte High Write Enable	mem_addr[1]	Not Used (Driven Low)	Byte Low Write Enable																									
8-bit	Not Used (Driven High)	mem_addr[1]	mem_addr[0]	Byte Write Enable																									
mem_cs_n[5:0]	Output	H	Low with internal pull-up	Memory Chip Select Negated Recommend external pull-up. Signals that a Memory Bank is actively selected.																									
mem_oe_n	Output	H	High	Memory Output Enable Negated Recommend external pull-up. Signals that a Memory Bank can output its data lines onto the cpu_ad bus.																									

Table 1 Pin Description (Part 1 of 7)

Name	Type	Reset State Status	Drive Strength Capability	Description
mem_we_n[3:0]	Output	H	High	Memory Write Enable Negated Bus Signals which bytes are to be written during a memory transaction. Bits act as Byte Enable and mem_addr[1:0] signals for 8-bit or 16-bit wide addressing.
mem_wait_n	Input		—	Memory Wait Negated Requires external pull-up. SRAM/IOI/IOM modes: Allows external wait-states to be injected during last cycle before data is sampled. DPM (dual-port) mode: Allows dual-port busy signal to restart memory transaction. Alternate function: sdram_wait_n.
mem_245_oe_n	Output	H	Low	Memory FCT245 Output Enable Negated Controls output enable to optional FCT245 transceiver bank by asserting during both reads and writes to a memory or I/O bank.
mem_245_dt_r_n	Output	Z	High	Memory FCT245 Direction Xmit/Rcv Negated Recommend external pull-up. Alternate function: cpu_dt_r_n. See CPU Core Specific Signals below.
output_clk	Output	cpu_masterclk	High	Output Clock Optional clock output.

PCI Interface

pci_ad[31:0]	I/O	Z	PCI	PCI Multiplexed Address/Data Bus Address driven by Bus Master during initial frame_n assertion, and then the Data is driven by the Bus Master during writes; or the Data is driven by the Bus Slave during reads.
pci_cbe_n[3:0]	I/O	Z	PCI	PCI Multiplexed Command/Byte Enable Bus Command (not negated) Bus driven by the Bus Master during the initial frame_n assertion. Byte Enable Negated Bus driven by the Bus Master during the data phase(s).
pci_par	I/O	Z	PCI	PCI Parity Even parity of the pci_ad[31:0] bus. Driven by Bus Master during Address and Write Data phases. Driven by the Bus Slave during the Read Data phase.
pci_frame_n	I/O	Z	PCI	PCI Frame Negated Driven by the Bus Master. Assertion indicates the beginning of a bus transaction. De-assertion indicates the last datum.
pci_trdy_n	I/O	Z	PCI	PCI Target Ready Negated Driven by the Bus Slave to indicate the current datum can complete.
pci_irdy_n	I/O	Z	PCI	PCI Initiator Ready Negated Driven by the Bus Master to indicate that the current datum can complete.
pci_stop_n	I/O	Z	PCI	PCI Stop Negated Driven by the Bus Slave to terminate the current bus transaction.
pci_idsel_n	Input		—	PCI Initialization Device Select Uses pci_req_n[2] pin. See the PCI subsection.
pci_perr_n	I/O	Z	PCI	PCI Parity Error Negated Driven by the receiving Bus Agent 2 clocks after the data is received, if a parity error occurs.
pci_serr_n	I/O Open-collector	Z	PCI	System Error External pull-up resistor is required. Driven by any agent to indicate an address parity error, data parity during a Special Cycle command, or any other system error.
pci_clk	Input		—	PCI Clock Clock for PCI Bus transactions. Uses the rising edge for all timing references.

Table 1 Pin Description (Part 2 of 7)

Name	Type	Reset State Status	Drive Strength Capability	Description
pci_rst_n	Input	L	—	PCI Reset Negated Host mode: Resets all PCI related logic. Satellite mode: Resets all PCI related logic and also warm resets the 32334.
pci_devsel_n	I/O	Z	PCI	PCI Device Select Negated Driven by the target to indicate that the target has decoded the present address as a target address.
pci_req_n[2]	Input	Z	—	PCI Bus Request #2 Negated Requires external pull-up. Host mode: pci_req_n[2] is an input indicating a request from an external device. Satellite mode: used as pci_idsel pin which selects this device during a configuration read or write. Alternate function: pci_idsel (satellite).
pci_req_n[1]	Input	Z	—	PCI Bus Request #1 Negated Requires external pull-up. Host mode: pci_req_n[1] is an input indicating a request from an external device. Alternate function: Unused (satellite).
pci_req_n[0]	I/O	Z	High	PCI Bus Request #0 Negated Requires external pull-up for burst mode. Host mode: pci_req_n[0] is an input indicating a request from an external device. Satellite mode: pci_req_n[0] is an output indicating a request from this device.
pci_gnt_n[2]	Output	Z ¹	High	PCI Bus Grant #2 Negated Recommend external pull-up. Host mode: pci_gnt_n[2] is an output indicating a grant to an external device. Satellite mode: pci_gnt_n[2] is used as the pci_inta_n output pin. Alternate function: pci_inta_n (satellite).
pci_gnt_n[1] / pci_eeeprom_cs	I/O	X for 1 pci clock then H ²	High	PCI Bus Grant #1 Negated Recommend external pull-up. Host mode: pci_gnt_n[1] is an output indicating a grant to an external device. Satellite mode: Used as pci_eprom_cs output pin for Serial Chip Select for loading PCI Configuration Registers in the RC32334 Reset Initialization Vector PCI boot mode. Defaults to the output direction at reset time. 1st Alternate function: pci_eeeprom_cs (satellite). 2nd Alternate function: PIO[11].
pci_gnt_n[0]	I/O	Z	High	PCI Bus Grant #0 Negated Host mode: pci_gnt_n[0] is an output indicating a grant to an external device. Recommend external pull-up. Satellite mode: pci_gnt_n[0] is an input indicating a grant to this device. Require external pull-up.
pci_inta_n	Output Open- collector	Z	PCI	PCI Interrupt #A Negated Uses pci_gnt_n[2]. See the PCI subsection.
pci_lock_n	Input		—	PCI Lock Negated Driven by the Bus Master to indicate that an exclusive operation is occurring.

¹ Z in host mode; L in satellite non-boot mode; Z in satellite boot mode.
² H in host mode; L in satellite non-boot and boot modes. X = unknown.

SDRAM Control Interface

sdram_addr_12	Output	L	High	SDRAM Address Bit 12 and Precharge All SDRAM mode: Provides SDRAM address bit 12 (10 on the SDRAM chip) during row address and "pre-charge all" signal during refresh, read and write command.
sdram_ras_n	Output	H	High	SDRAM RAS Negated SDRAM mode: Provides SDRAM RAS control signal to all SDRAM banks.

Table 1 Pin Description (Part 3 of 7)

Name	Type	Reset State Status	Drive Strength Capability	Description
sdras_cas_n	Output	H	High	SDRAM CAS Negated SDRAM mode: Provides SDRAM CAS control signal to all SDRAM banks.
sdras_we_n	Output	H	High	SDRAM WE Negated SDRAM mode: Provides SDRAM WE control signal to all SDRAM banks.
sdras_cke	Output	H	High	SDRAM Clock Enable SDRAM mode: Provides clock enable to all SDRAM banks.
sdras_cs_n[3:0]	Output	H	High	SDRAM Chip Select Negated Bus Recommend external pull-up. SDRAM mode: Provides chip select to each SDRAM bank. SODIMM mode: Provides upper select byte enables [7:4].
sdras_s_n[1:0]	Output	H	High	SDRAM SODIMM Select Negated Bus SDRAM mode: Not used. SDRAM SODIMM mode: Upper and lower chip selects.
sdras_bemask_n [3:0]	Output	H	High	SDRAM Byte Enable Mask Negated Bus (DQM) SDRAM mode: Provides byte enables for each byte lane of all DRAM banks. SODIMM mode: Provides lower select byte enables [3:0].
sdras_245_oe_n	Output	H	Low	SDRAM FCT245 Output Enable Negated Recommend external pull-up. SDRAM mode: Controls output enable to optional FCT245 transceiver bank by asserting during both reads and writes to any DRAM bank.
sdras_245_dt_r_n	Output	Z	High	SDRAM FCT245 Direction Transmit/Receive Recommend external pull-up. Uses cpu_dt_r_n. See CPU Core Specific Signals below.

On-Chip Peripherals

dma_ready_n[1:0] / dma_done_n[1:0]	I/O	Z	Low	DMA Ready Negated Bus Requires external pull-up. Ready mode: Input pin for each general purpose DMA channel that can initiate the next datum in the current DMA descriptor frame. Done mode: Input pin for each general purpose DMA channel that can terminate the current DMA descriptor frame. dma_ready_n[0] 1st Alternate function PIO[1]; 2nd Alternate function: dma_done_n[0]. dma_ready_n[1] 1st Alternate function PIO[0]; 2nd Alternate function: dma_done_n[1].
pio[15:0]	I/O	See related pins	Low	Programmable Input/Output General purpose pins that can each be configured as a general purpose input or general purpose output. These pins are multiplexed with other pin functions: uart_cts_n[0], uart_dsr_n[0], uart_dtr_n[0], uart_rts_n[0], pci_gnt_n[1], spi_mosi, spi_miso, spi_sck, spi_ss_n, uart_rx[0], uart_tx[0], uart_rx[1], uart_tx[1], timer_tc_n[0], dma_ready_n[0], dma_ready_n[1]. Note that pci_gnt_n[1], spi_mosi, spi_sck, and spi_ss_n default to outputs at reset time. The others default to inputs.
timer_tc_n[0] / timer_gate_n[0]	I/O	Z	Low	Timer Terminal Count Overflow Negated Terminal count mode (timer_tc_n): Output indicating that the timer has reached its count compare value and has overflowed back to 0. Gate mode (timer_gate_n): input indicating that the timer may count one tick on the next clock edge. 1st Alternate function: PIO[2]. 2nd Alternate function: timer_gate_n[0].
uart_rx[1:0]	I/O	Z	Low	UART Receive Data Bus UART mode: Each UART channel receives data on their respective input pin. uart_rx[0] Alternate function: PIO[6]. uart_rx[1] Alternate function: PIO[4].

Table 1 Pin Description (Part 4 of 7)

Name	Type	Reset State Status	Drive Strength Capability	Description
uart_tx[1:0]	I/O	Z	Low	UART Transmit Data Bus UART mode: Each UART channel sends data on their respective output pin. Note that these pins default to inputs at reset time and must be programmed via the PIO interface before being used as UART outputs. uart_tx[0] Alternate function: PIO[5]. uart_tx[1] Alternate function: PIO[3].
uart_cts_n[0] uart_dsr_n[0] uart_dtr_n[0] uart_rts_n[0]	I/O	Z	Low	UART Transmit Data Bus UART mode: Data bus modem control signal pins for UART channel 0. uart_cts_n[0] Alternate function: PIO[15]. uart_dsr_n[0] Alternate function: PIO[14]. uart_dtr_n[0] Alternate function: PIO[13]. uart_rts_n[0] Alternate function: PIO[12].
spi_mosi	I/O	L	Low	SPI Data Output Serial mode: Output pin from RC32334 as an Input to a Serial Chip for the Serial data input stream. In PCI satellite mode, acts as an Output pin from RC32334 that connects as an Input to a Serial Chip for the Serial data input stream for loading PCI Configuration Registers in the RC32334 Reset Initialization Vector PCI boot mode. 1st Alternate function: PIO[10]. Defaults to the output direction at reset time. 2nd Alternate function: pci_eeeprom_mdo.
spi_miso	I/O	Z	Low	SPI Data Input Serial mode: Input pin to RC32334 from the Output of a Serial Chip for the Serial data output stream. In PCI satellite mode, acts as an Input pin from RC32334 that connects as an output to a Serial Chip for the Serial data output stream for loading PCI Configuration Registers in the RC32334 Reset Initialization Vector PCI boot mode. Defaults to input direction at reset time. 1st Alternate function: PIO[7]. 2nd Alternate function: pci_eeeprom_mdi.
spi_sck	I/O	L	Low	SPI Clock Serial mode: Output pin for Serial Clock. In PCI satellite mode, acts as an Output pin for Serial Clock for loading PCI Configuration Registers in the RC323334 Reset Initialization Vector PCI boot mode. 1st Alternate function: PIO[9]. Defaults to the output direction at reset time. 2nd Alternate function: pci_eeeprom_sk.
spi_ss_n	I/O	H	Low	SPI Chip Select Output pin selecting the serial protocol device as opposed to the PCI satellite mode EEPROM device. Alternate function: PIO[8]. Defaults to the output direction at reset time.

CPU Core Specific Signals

cpu_nmi_n	Input		—	CPU Non-Maskable Interrupt Requires external pull-up. This interrupt input is active low to the CPU.
cpu_masterclk	Input		—	CPU Master System Clock Provides the basic system clock.
cpu_int_n[5:4], [2:0]	Input		—	CPU Interrupt Requires external pull-up. These interrupt inputs are active low to the CPU.
cpu_coldreset_n	Input	L	—	CPU Cold Reset This active-low signal is asserted to the RC32334 after V_{CC} becomes valid on the initial power-up. The Reset initialization vectors for the RC32334 are latched by cold reset.

Table 1 Pin Description (Part 5 of 7)

Name	Type	Reset State Status	Drive Strength Capability	Description
cpu_dt_r_n	Output	Z	—	CPU Direction Transmit/Receive This active-low signal controls the DT/R pin of an optional FCT245 transceiver bank. It is asserted during read operations. 1st Alternate function: mem_245_dt_r_n. 2nd Alternate function: sdram_245_dt_r_n.

JTAG Interface Signals

jtag_tck	Input		—	JTAG Test Clock Requires external pull-down. An input test clock used to shift into or out of the Boundary-Scan register cells. jtag_tck is independent of the system and the processor clock with nominal 50% duty cycle.
jtag_tdi, ejtag_dint_n	Input		—	JTAG Test Data In Requires an external pull-up on the board. On the rising edge of jtag_tck, serial input data are shifted into either the Instruction or Data register, depending on the TAP controller state. During Real Mode, this input is used as an interrupt line to stop the debug unit from Real Time mode and return the debug unit back to Run Time Mode (standard JTAG). This pin is also used as the ejtag_dint_n signal in the EJTAG mode.
jtag_tdo, ejtag_tpc	Output	Z	High	JTAG Test Data Out The jtag_tdo is serial data shifted out from instruction or data register on the falling edge of jtag_tck. When no data is shifted out, the jtag_tdo is tri-stated. During Real Time Mode, this signal provides a non-sequential program counter at the processor clock or at a division of processor clock. This pin is also used as the ejtag_tpc signal in the EJTAG mode.
jtag_tms	Input		—	JTAG Test Mode Select Requires external pull-up. The logic signal received at the jtag_tms input is decoded by the TAP controller to control test operation. jtag_tms is sampled on the rising edge of the jtag_tck.
jtag_trst_n	Input	L	—	JTAG Test Reset When neither JTAG nor EJTAG are being used, jtag_trst_n must be driven low (pulled down) or the jtag_tms/ejtag_tms signals must be pulled up and jtag_clk actively clocked.
ejtag_dclk	Output	Z	—	EJTAG Test Clock Processor Clock. During Real Time Mode, this signal is used to capture address and data from the ejtag_tpc signal at the processor clock speed or any division of the internal pipeline.
ejtag_pcst[2:0]	I/O	Z	Low	EJTAG PC Trace Status Information 111 (STL) Pipe line Stall 110 (JMP) Branch/Jump forms with PC output 101 (BRT) Branch/Jump forms with no PC output 100 (EXP) Exception generated with an exception vector code output 011 (SEQ) Sequential performance 010 (TST) Trace is outputted at pipeline stall time 001 (TSQ) Trace trigger output at performance time 000 (DBM) Run Debug Mode Alternate function: modebit[2:0].
ejtag_debugboot	Input		— Requires external pull-down	EJTAG DebugBoot The ejtag_debugboot input is used during reset and forces the CPU core to take a debug exception at the end of the reset sequence instead of a reset exception. This enables the CPU to boot from the ICE probe without having the external memory working. This input signal is level sensitive and is not latched internally. This signal will also set the JtagBrk bit in the JTAG_Control_Register[12].
ejtag_tms	Input		— Requires external pull-up	EJTAG Test Mode Select An external pull-up on the board is required. The ejtag_tms is sampled on the rising edge of jtag_tck.

Table 1 Pin Description (Part 6 of 7)

Name	Type	Reset State Status	Drive Strength Capability	Description
Debug Signals				
debug_cpu_dma_n	I/O	Z	Low	Debug CPU versus DMA Negated De-assertion high during debug_cpu_ads_n assertion or debug_cpu_ack_n assertion indicates transaction was generated from the CPU. Assertion low during debug_cpu_ads_n assertion or debug_cpu_ack_n assertion indicates transaction was generated from DMA. Alternate function: modebit[6].
debug_cpu_ack_n	I/O	Z	Low	Debug CPU Acknowledge Negated Indicates either a data acknowledge to the CPU or DMA. Alternate function: modebit[4].
debug_cpu_ads_n	I/O	Z	Low	Debug CPU Address/Data Strobe Negated Assertion indicates that either a CPU or a DMA transaction is beginning and that the mem_data[31:4] bus has the current block address. Alternate function: modebit[5].
debug_cpu_i_d_n	I/O	Z	Low	Debug CPU Instruction versus Data Negated Assertion during debug_cpu_ads_n assertion or debug_cpu_ack_n assertion indicates transaction is a CPU or DMA data transaction. De-assertion during debug_cpu_ads_n assertion or debug_cpu_ack_n assertion indicates transaction is a CPU instruction transaction. Alternate function: modebit[3].

Table 1 Pin Description (Part 7 of 7)

Mode Bit Settings to Configure Controller on Reset

The following table lists the mode bit settings to configure the controller on cold reset.

Pin	Mode Bit	Description	Value	Mode Setting
ejtag_pcst[2:0]	2:0 MSB (2)	Clock Multiplier MasterClock is multiplied internally to generate PClock	0	Multiply by 2
			1	Multiply by 3
			2	Multiply by 4
			3	Reserved
			4	Reserved
			5	Reserved
			6	Reserved
			7	Reserved
debug_cpu_i_d_n	3	EndBit	0	Little-endian ordering
			1	Big-endian ordering
debug_cpu_ack_n	4	Reserved	0	
debug_cpu_ads_n	5	Reserved	0	
debug_cpu_dma_n	6	TmrIntEn Enables/Disables the timer interrupt on Int*[5]	0	Enables timer interrupt
			1	Disables timer interrupt
mem_addr[17]	7	Reserved for future use	1	

Table 2 Boot-Mode Configuration Settings (Part 1 of 2)

Pin	Mode Bit	Description	Value	Mode Setting
mem_addr[19:18]	9:8 MSB (9)	Boot-Prom Width specifies the memory port width of the memory space which contains the boot prom.	00	8 bits
			01	16 bits
			10	32 bits
			11	Reserved

Table 2 Boot-Mode Configuration Settings (Part 2 of 2)

reset_boot_mode Settings

By using the non-boot mode cold reset initialization mode the user can change the internal register addresses from base 1800_0000 to base 1900_0000, as required. The RC32334 cold reset-boot mode initialization setting values and mode descriptions are listed below.

Pin	Reset Boot Mode	Description	Value	Mode Settings
mem_addr[22:21]	1:0 MSB (1)	Tri-state memory bus and EEPROM bus during cold reset_n assertion	11	Tri-state_bus_mode
		Reserved	10	
		PCI-boot mode (pci_host_mode must be in satellite mode) RC32334 will reset either from a cold reset or from a PCI reset. Boot code is provided via PCI.	01	PCI_boot_mode
		Standard-boot mode Boot from the RC32334's memory controller (typical system).	00	standard_boot_mode

Table 3 RC32334 reset_boot_mode Initialization Settings

pci_host_mode Settings

During cold reset initialization, the RC32334's PCI interface can be set to the Satellite or Host mode settings. When set to the Host mode, the CPU must configure the RC32334's PCI configuration registers, including the read-only registers. If the RC32334's PCI is in the PCI-boot mode Satellite mode, read-only configuration registers are loaded by the serial EEPROM.

Pin	Reset Boot Mode	Description	Value	Mode Settings
mem_addr[20]	PCI host mode	PCI is in satellite mode	1	PCI_satellite
		PCI is in host mode (typical system)	0	PCI_host

Table 4 RC32334 pci_host_mode Initialization Settings

Table 5 Clock Parameters - RC32334

¹ cpu_masterclock frequency should never be below pci_clk frequency if PCI interface is used.

² Rise and fall times are measured between 10% and 90%

³ Output_clk should not be used in a system. Only the cpu_masterclock or its derivative must be used to drive all the subsystems with designs based on the RC32334 device. Refer to the RC3233x Device Errata for more information.

Reset Specification

Figure 3 Mode Configuration Interface Cold Reset Sequence

Power Ramp-up

There is no special requirement for how fast Vcc and VccP ramp up to 3.3V. However, all timing references are based on Vcc and VccP stabilized at 3.3V -5%.

Table 6 AC Timing Characteristics - RC32334 (Part 4 of 4)

¹. At all pipeline frequencies.

². Guaranteed by design.

³. pci_rst_n is tested per PCI 2.2 as an asynchronous signal.

Standard EJTAG Timing — RC32334

Figure 4 represents the timing diagram for the EJTAG interface signals.

The standard JTAG connector is a 10-pin connector providing 5 signals and 5 ground pins. For Standard EJTAG, a 24-pin connector has been chosen providing 12 signals and 12 ground pins. This guarantees elimination of noise problems by incorporating signal-ground type arrangement. Refer to the RC32334 User Reference Manual for connector pinout and mechanical specifications.

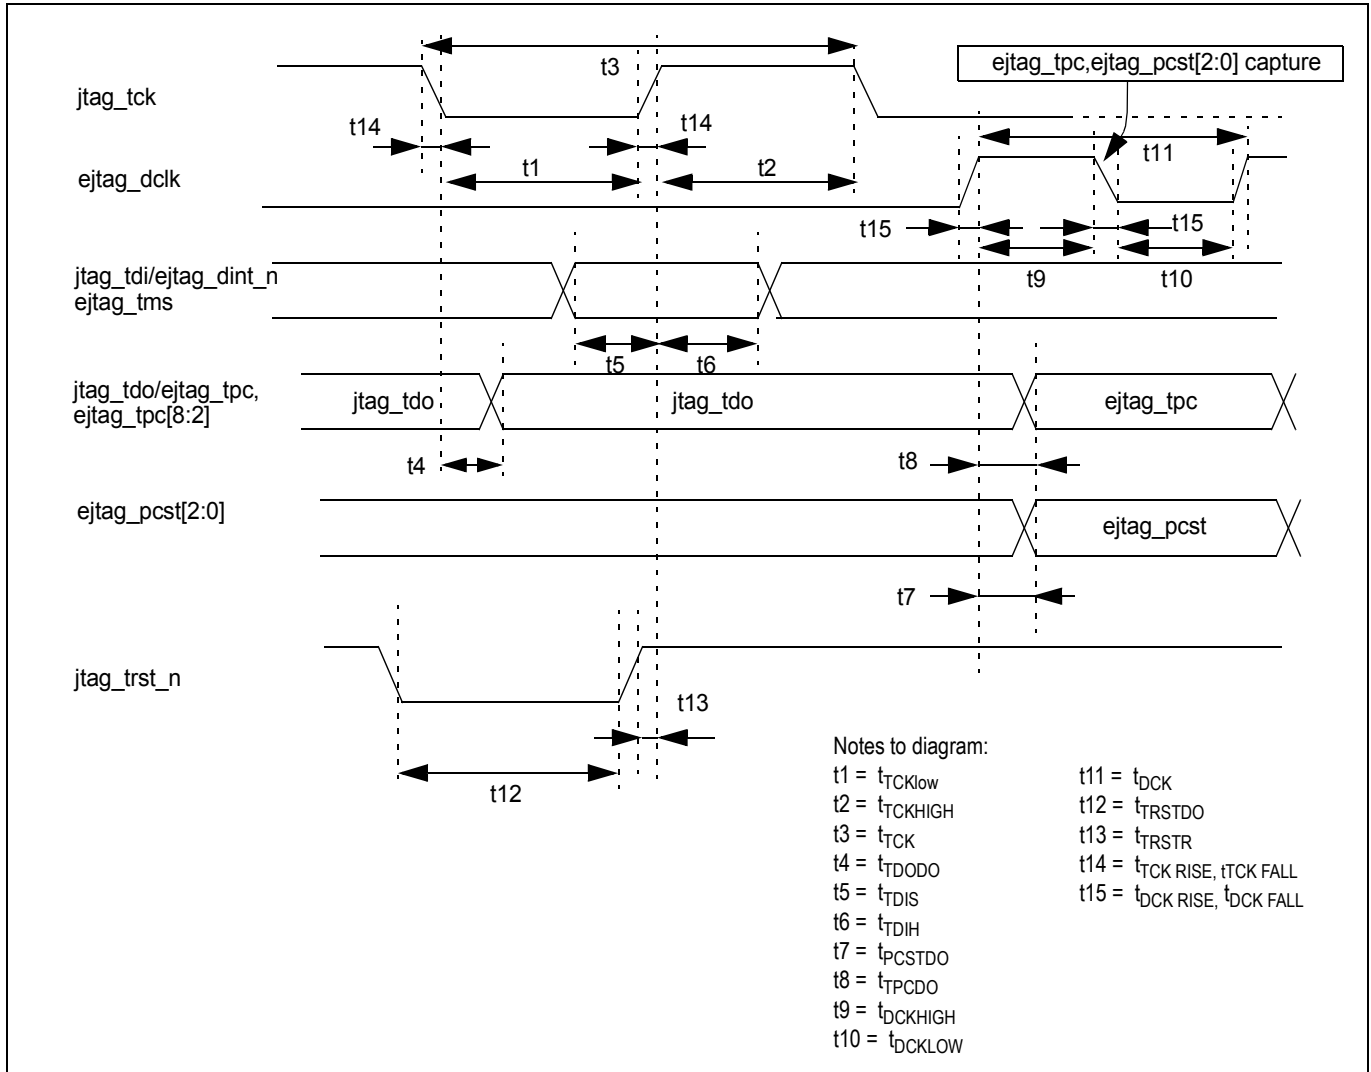

Figure 4 Standard EJTAG Timing

Output Loading for AC Testing

Signal	C _{ld}
All High Drive Signals	50 pF
All Low Drive Signals	25 pF

Figure 5 Output Loading for AC Testing

Note: PCI pins have been correlated to PCI 2.2.

Recommended Operation Temperature and Supply Voltage

Grade	Temperature	Gnd	V _{cc} IO	V _{cc} Core	V _{cc} P
Commercial	0°C to +70°C (Ambient)	0V	3.3V±5%	3.3V±5%	3.3V±5%
Industrial	-40°C to +85°C (Ambient)	0V	3.3V±5%	3.3V±5%	3.3V±5%

Table 7 Temperature and Voltage

DC Electrical Characteristics — RC32334

Commercial Temperature Range—RC32334

(T_a = 0°C to +70°C Commercial, T_a = -40°C to +85°C Industrial, V_{cc} I/O = +3.3V±5%, V_{cc} Core = +3.3V±5%)

Table 8 DC Electrical Characteristics - RC32334 (Part 2 of 2)

¹ At all pipeline frequencies.

² Applies only to pad T3.

³ Applies only to pad R3.

Capacitive Load Deration — RC32334

Refer to the IDT document [79RC32334 IBIS Model](#) located on the company's web site.

Power Consumption — RC32334

Note: This table is based on a 2:1 pipeline-to-bus clock ratio.

Parameter		100MHz RC32334		133MHz RC32334		150MHz RC32334		Unit	Conditions
		Typical	Max.	Typical	Max.	Typical	Max.		
I _{CC}	Normal mode	360	480	480	630	550	700	mA	C _L = (See Figure 5, Output Loading for AC Testing) T _a = 25°C V _{CC} core = 3.46V (for max. values) V _{CC} I/O = 3.46V (for max. values) V _{CC} core = 3.3V (for typical values) V _{CC} I/O = 3.3V (for typical values)
	Standby mode ¹	250	370	330	480	390	540	mA	
Power Dissipation	Normal mode	1.2	1.7	1.5	2.2	1.7	2.4	W	
	Standby mode ¹	.87	1.3	1.1	1.7	1.3	1.9	W	

Table 9 Power Consumption

¹ RISCore 32300 CPU core enters Standby mode by executing WAIT instructions. On-chip logic outside the CPU core continues to function.

Power Ramp-up

There is no special requirement for how fast V_{CC} I/O ramps up to 3.3V. However, all timing references are based on a stable V_{CC} I/O.

Power Curves

The following two graphs contain the simulated power curves that show power consumption at various bus frequencies.

Note: Only pipeline frequencies that are integer multiples (2x, 3x, 4x) of bus frequencies are supported.

Figure 6 Typical Power Usage - RC32334

Figure 7 Maximum Power Usage - RC32334

Absolute Maximum Ratings

Symbol	Parameter	Min ¹	Max ¹	Unit
V _{CC}	Supply Voltage	-0.3	4.0	V
V _i	Input Voltage	-0.3	5.5	V
V _{imin}	Input Voltage - undershoot ²	-0.6	—	V
T _{stg}	Storage Temperature	-40	125	degrees C

Table 10 Absolute Maximum Ratings

¹ Functional and tested operating conditions are given in Table 7. Absolute maximum ratings are stress ratings only, and functional operation is not guaranteed beyond recommended operating voltages and temperatures. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.

² All PCI pads are fully compatible with PCI Specification version 2.2.

Package Pin-out — 256-PBGA Pinout for RC32334

The following table lists the pin numbers and signal names for the RC32334. Signal names ending with an “_n” are active when low.

Pin	Function	Alt	Pin	Function	Alt	Pin	Function	Alt	Pin	Function	Alt
A1	uart_cts_n[0]	1	E1	mem_cs_n[4]		J1	debug_cpu_dma_n	1	N1	cpu_int_n[1]

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
