

## FEATURES:

- Eight channel T1/E1/J1 long haul/short haul line interfaces
- Supports HPS (Hitless Protection Switching) for 1+1 protection without external relays
- Receiver sensitivity exceeds -36 dB@772KHz and -43 dB@1024 KHz
- Programmable T1/E1/J1 switchability allowing one bill of material for any line condition
- Single 3.3 V power supply with 5 V tolerance on digital interfaces
- Meets or exceeds specifications in
  - ANSI T1.102, T1.403 and T1.408
  - ITU I.431, G.703, G.736, G.775 and G.823
  - ETSI 300-166, 300-233 and TBR 12/13
  - AT&T Pub 62411
- Per channel software selectable on:
  - Wave-shaping templates for short haul and long haul LBO (Line Build Out)
  - Line terminating impedance (T1:100 Ω, J1:110 Ω, E1:75 Ω/120 Ω)
  - Adjustment of arbitrary pulse shape
  - JA (Jitter Attenuator) position (receive path or transmit path)
  - Single rail/dual rail system interfaces
  - B8ZS/HDB3/AMI line encoding/decoding
  - Active edge of transmit clock (TCLK) and receive clock (RCLK)
- Active level of transmit data (TDATA) and receive data (RDATA)
- Receiver or transmitter power down
- High impedance setting for line drivers
- PRBS (Pseudo Random Bit Sequence) generation and detection with  $2^{15}-1$  PRBS polynomials for E1
- QRSS (Quasi Random Sequence Signals) generation and detection with  $2^{20}-1$  QRSS polynomials for T1/J1
- 16-bit BPV (Bipolar Pulse Violation)/Excess Zero/PRBS or QRSS error counter
- Analog loopback, Digital loopback, Remote loopback and Inband loopback
- Per channel cable attenuation indication
- Adaptive receive sensitivity
- Non-intrusive monitoring per ITU G.772 specification
- Short circuit protection for line drivers
- LOS (Loss Of Signal) & AIS (Alarm Indication Signal) detection
- JTAG interface
- Supports serial control interface, Motorola and Intel Non-Multiplexed interfaces
- Package:  
IDT82V2088: 208-pin PQFP and 208-pin PBGA

## DESCRIPTION:

The IDT82V2088 can be configured as an octal T1, octal E1 or octal J1 Line Interface Unit. In receive path, an Adaptive Equalizer is integrated to remove the distortion introduced by the cable attenuation. The IDT82V2088 also performs clock/data recovery, AMI/B8ZS/HDB3 line decoding and detects and reports the LOS conditions. In transmit path, there is an AMI/B8ZS/HDB3 encoder, Waveform Shaper and LBOs. There is one Jitter Attenuator for each channel, which can be placed in either the receive path or the transmit path. The Jitter Attenuator can also be disabled. The IDT82V2088 supports both Single Rail and Dual Rail system interfaces and

both serial and parallel control interfaces. To facilitate the network maintenance, a PRBS/QRSS generation/detection circuit is integrated in each channel, and different types of loopbacks can be set on a per channel basis. Four different kinds of line terminating impedance, 75 Ω, 100 Ω, 110 Ω and 120 Ω are selectable on a per channel basis. The chip also provides driver short-circuit protection and supports JTAG boundary scanning.

The IDT82V2088 can be used in SDH/SONET, LAN, WAN, Routers, Wireless Base Stations, IADs, IMAs, IMAPs, Gateways, Frame Relay Access Devices, CSU/DSU equipment, etc.

## 2 PIN DESCRIPTION

Table-1 Pin Description

Name	Type	Pin No.		Description
		PQFP208	PBGA208	
<b>Transmit and Receive Line Interface</b>				
TTIP1	Output Analog	164	A13	<b>TTIPn<sup>1</sup>/TRINGn: Transmit Bipolar Tip/Ring for Channel 1-8</b> These pins are the differential line driver outputs and can be set to high impedance state globally or individually. A logic high on THZ pin turns all these pins into high impedance state. When THZ bit (TCF1, 03H...) is set to '1', the TTIPn/TRINGn in the corresponding channel is set to high impedance state.  In summary, these pins will become high impedance in the following conditions: <ul style="list-style-type: none"> <li>• THZ pin is high: all TTIPn/TRINGn enter high impedance;</li> <li>• THZn bit is set to 1: the corresponding TTIPn/TRINGn become high impedance;</li> <li>• Loss of MCLK: all TTIPn/TRINGn pins become high impedance;</li> <li>• Loss of TCLKn: the corresponding TTIPn/TRINGn become HZ (exceptions: Remote Loopback; Transmit internal pattern by MCLK);</li> <li>• Transmitter path power down: the corresponding TTIPn/TRINGn become high impedance;</li> <li>• After software reset: pin reset and power on: all TTIPn/TRINGn enter high impedance.</li> </ul>

## Notes:

1. The footprint 'n' (n = 1-8) represents one of the eight channels.
2. The name and address of the registers that contain the preceding bit. Only the address of channel 1 register is listed, the rest addresses are represented by '...'. Users can find these omitted addresses in the *Register Description* section.

Table-1 Pin Description (Continued)

Name	Type	Pin No.		Description															
		PQFP208	PBGA208																
<b>Transmit and Receive Digital Data Interface</b>																			
TD1/TDP1 TD2/TDP2 TD3/TDP3 TD4/TDP4 TD5/TDP5 TD6/TDP6 TD7/TDP7 TD8/TDP8	Input	155 149 143 137 127 121 115 109	B15 D15 E15 G15 J15 L15 N15 R16	<p><b>TDn: Transmit Data for Channel 1-8</b> In Single Rail Mode, the NRZ data to be transmitted is input on these pins. Data on TDn is sampled into the device on the active edge of TCLKn. The active edge of TCLKn is selected by the TCLK_SEL bit (TCF0, 02H...). Data is encoded by AMI, HDB3 or B8ZS line code rules before being transmitted to the line. In this mode, TDNn should be connected to ground.</p> <p><b>TDPn/TDNn: Positive/Negative Transmit Data for Channel 1-8</b> In Dual Rail Mode, the NRZ data to be transmitted is input on these pins. Data on TDPn/TDNn is sampled into the device on the active edge of TCLKn. The active edge of the TCLKn is selected by the TCLK_SEL bit (TCF0, 02H...). The line code in Dual Rail Mode is as follows:</p> <table border="1" style="margin-left: 20px;"> <thead> <tr> <th>TDPn</th> <th>TDNn</th> <th>Output Pulse</th> </tr> </thead> <tbody> <tr> <td>0</td> <td>0</td> <td>Space</td> </tr> <tr> <td>0</td> <td>1</td> <td>Positive Pulse</td> </tr> <tr> <td>1</td> <td>0</td> <td>Negative Pulse</td> </tr> <tr> <td>1</td> <td>1</td> <td>Space</td> </tr> </tbody> </table>	TDPn	TDNn	Output Pulse	0	0	Space	0	1	Positive Pulse	1	0	Negative Pulse	1	1	Space
TDPn		TDNn	Output Pulse																
0		0	Space																
0		1	Positive Pulse																
1		0	Negative Pulse																
1		1	Space																
TDN1 TDN2 TDN3 TDN4 TDN5 TDN6 TDN7 TDN8			154 148 142 136 126 120 114 108	C14 D14 F13 G14 J14 L14 M13 P15															
TCLK1 TCLK2 TCLK3 TCLK4 TCLK5 TCLK6 TCLK7 TCLK8		Input	156 150 144 138 129 122 116 110	A15 C16 E16 G16 J16 L16 N16 T16	<p><b>TCLKn: Transmit Clock for Channel 1-8</b> These pins input 1.544 MHz for T1/J1 mode or 2.048 MHz for E1 mode transmit clock. The transmit data on TDn/TDPn or TDNn is sampled into the device on the active edge of TCLKn. If TCLKn is missing<sup>1</sup> and the TCLKn missing interrupt is not masked, an interrupt will be generated.</p>														
RD1/RDP1 RD2/RDP2 RD3/RDP3 RD4/RDP4 RD5/RDP5 RD6/RDP6 RD7/RDP7 RD8/RDP8			Output	152 146 140 134 124 118 112 106	B16 E14 F15 H14 K14 M15 N14 P14	<p><b>RDn: Receive Data for Channel 1-8</b> In Single Rail Mode, the NRZ receive data is output on these pins. Data is decoded according to AMI, HDB3 or B8ZS line code rules. The active level on RDn pin is selected by the RD_INV bit (RCF0, 07H...).</p> <p><b>CVn: Code Violation for Channel 1-8</b> In Single Rail Mode, the BPV/CV errors in received data streams will be reported by driving pin CVn to high level for a full clock cycle. The B8ZS/HDB3 line code violation can be indicated when the B8ZS/HDB3 decoder is enabled. When AMI decoder is selected, the bipolar violation can be indicated.</p>													
CV1/RDN1 CV2/RDN2 CV3/RDN3 CV4/RDN4 CV5/RDN5 CV6/RDN6 CV7/RDN7 CV8/RDN8					151 145 139 132 123 117 111 105	C15 E13 F14 H13 K13 M14 N13 R15	<p><b>RDPn/RDNn: Positive/Negative Receive Data for Channel 1-8</b> In Dual Rail Mode with Clock &amp; Data Recovery (CDR), these pins output the NRZ data with the recovered clock. An active level on RDPn indicates the receipt of a positive pulse on RTIPn/RRINGn while an active level on RDNn indicates the receipt of a negative pulse on RTIPn/RRINGn. The active level on RDPn/RDNn is selected by the RD_INV bit (RCF0, 07H...). When CDR is disabled, these pins directly output the raw RZ sliced data. The output data on RDn and RDPn/RDNn is updated on the active edge of RCLKn.</p>												
RCLK1 RCLK2 RCLK3 RCLK4 RCLK5 RCLK6 RCLK7 RCLK8				Output	153 147 141 135 125 119 113 107	A16 D16 F16 H15 K15 M16 P16 T15	<p><b>RCLKn: Receive Clock for Channel 1-8</b> These pins output 1.544 MHz for T1/J1 mode or 2.048 MHz for E1 mode receive clock. Under LOS conditions, if AISE bit (MAINT0, 0AH...) is '1', RCLKn is derived from MCLK. In clock recovery mode, these pins provide the clock recovered from the signal received on RTIPn/RRINGn. The receive data (RDn in Single Rail Mode or RDPn/RDNn in Dual Rail Mode) is updated on the active edge of RCLKn. The active edge is selected by the RCLK_SEL bit (RCF0, 07H...). If clock recovery is bypassed, RCLKn is the exclusive OR(XOR) output of the Dual Rail sliced data RDPn and RDNn. This signal can be used in the applications with external clock recovery circuitry.</p>												

Notes:

1. TCLKn missing: the state of TCLKn continues to be high level or low level over 70 clock cycles.

Table-1 Pin Description (Continued)

Name	Type	Pin No.		Description												
		PQFP208	PBGA208													
MCLK	Input	17	G1	<p><b>MCLK: Master Clock</b>                      MCLK is an independent, free-running reference clock. It is a single reference for all operation modes and provides selectable 1.544 MHz or 37.056 MHz for T1/J1 operating mode while 2.048 MHz or 49.152 MHz for E1 operating mode.</p> <p>The reference clock is used to generate several internal reference signals:</p> <ul style="list-style-type: none"> <li>• Timing reference for the integrated clock recovery unit.</li> <li>• Timing reference for the integrated digital jitter attenuator.</li> <li>• Timing reference for microcontroller interface.</li> <li>• Generation of RCLKn signal during a loss of signal condition.</li> <li>• Reference clock during Transmit All Ones (TAO) and all zeros condition. When sending PRBS/QRSS or Inband Loopback code, either MCLK or TCLKn can be selected as the reference clock.</li> <li>• Reference clock for ATA0 and AIS.</li> </ul> <p>The loss of MCLK will turn all the eight TTIP/TRING into high impedance status.</p>												
MCLKS	Input	56	R6	<p><b>MCLKS: Master Clock Select</b>                      If 2.048 MHz (E1) or 1.544 MHz (T1/J1) is selected as the MCLK, this pin should be connected to ground; and if the 49.152 MHz (E1) or 37.056 MHz (T1/J1) is selected as the MCLK, this pin should be pulled high.</p>												
LOS1 LOS2 LOS3 LOS4 LOS5 LOS6 LOS7 LOS8	Output	1 3 4 5 6 7 8 9	C2 C3 D1 D2 D3 E1 E2 E3	<p><b>LOS<sub>n</sub>: Loss of Signal Output for Channel 1~8</b>                      These pins are used to indicate the loss of received signals. When LOS<sub>n</sub> pin becomes high, it indicates the loss of received signals in channel n. The LOS<sub>n</sub> pin will become low automatically when valid received signal is detected again. The criteria of loss of signal are described in <a href="#">3.5 LOS AND AIS DETECTION</a>.</p>												
<b>Control Interface</b>

## 3 FUNCTIONAL DESCRIPTION

### 3.1 T1/E1/J1 MODE SELECTION

The IDT82V2088 can be used as an eight-channel E1 LIU or an eight-channel T1/J1 LIU. In E1 application, the T1E1 bit (GCF0, 40H) should be set to '0'. In T1/J1 application, the T1E1 bit should be set to '1'.

### 3.2 TRANSMIT PATH

The transmit path of each channel of the IDT82V2088 consists of an Encoder, an optional Jitter Attenuator, a Waveform Shaper, a set of LBOs, a Line Driver and a Programmable Transmit Termination.

#### 3.2.1 TRANSMIT PATH SYSTEM INTERFACE

The transmit path system interface consists of TCLKn pin, TDn/TDPn pin and TDNn pin. In E1 mode, the TCLKn is a 2.048 MHz clock. In T1/J1 mode, the TCLKn is a 1.544 MHz clock. If the TCLKn is missing for more than 70 MCLK cycles, an interrupt will be generated if it is not masked.

Transmit data is sampled on the TDn/TDPn and TDNn pins by the active edge of TCLKn. The active edge of TCLKn can be selected by the TCLK\_SEL bit (TCF0, 02H...). And the active level of the data on TDn/TDPn and TDNn can be selected by the TD\_INV bit (TCF0, 02H...).

The transmit data from the system side can be provided in two different ways: Single Rail and Dual Rail. In Single Rail mode, only TDn pin is used for transmitting data and the T\_MD[1] bit (TCF0, 02H...) should be set to '0'. In Dual Rail Mode, both TDPn and TDNn pins are used for transmitting data, the T\_MD[1] bit (TCF0, 02H...) should be set to '1'.

#### 3.2.2 ENCODER

When T1/J1 mode is selected, in Single Rail mode, the Encoder can be selected to be a B8ZS encoder or an AMI encoder by setting T\_MD[0] bit (TCF0, 02H...).

When E1 mode is selected, in Single Rail mode, the Encoder can be configured to be a HDB3 encoder or an AMI encoder by setting T\_MD[0] bit (TCF0, 02H...).

In both T1/J1 mode and E1 mode, when Dual Rail mode is selected (bit T\_MD[1] is '1'), the Encoder is by-passed. In the Dual Rail mode, a logic '1' on the TDPn pin and a logic '0' on the TDNn pin results in a negative pulse on the TTIPn/TRINGn; a logic '0' on TDPn pin and a logic '1' on TDNn pin results in a positive pulse on the TTIPn/TRINGn. If both TDPn and TDNn are logic '1' or logic '0', the TTIPn/TRINGn outputs a space (Refer to [TDn/TDPn, TDNn Pin Description](#)).

#### 3.2.3 PULSE SHAPER

The IDT82V2088 provides three ways of manipulating the pulse shape before sending it. The first is to use preset pulse templates for short haul application, the second is to use LBO (Line Build Out) for long haul application and the other way is to use user-programmable arbitrary waveform template.

##### 3.2.3.1 Preset Pulse Templates

For E1 applications, the pulse shape is shown in [Figure-4](#) according to the G.703 and the measuring diagram is shown in [Figure-5](#). In internal impedance matching mode, if the cable impedance is 75  $\Omega$ , the PULS[3:0]

bits (TCF1, 03H...) should be set to '0000'; if the cable impedance is 120  $\Omega$ , the PULS[3:0] bits (TCF1, 03H...) should be set to '0001'. In external impedance matching mode, for both E1/75  $\Omega$  and E1/120  $\Omega$  cable impedance, PULS[3:0] should be set to '0001'.

**Figure-4 E1 Waveform Template Diagram**

**Figure-5 E1 Pulse Template Test Circuit**

For T1 applications, the pulse shape is shown in [Figure-6](#) according to the T1.102 and the measuring diagram is shown in [Figure-7](#). This also meets the requirement of G.703, 2001. The cable length is divided into five grades, and there are five pulse templates used for each of the cable length. The pulse template is selected by PULS[3:0] bits (TCF1, 03H...).

**Figure-6 DSX-1 Waveform Template**

**Figure-7 T1 Pulse Template Test Circuit**

For J1 applications, the PULS[3:0] (TCF1, 03H...) should be set to '0111'. Table-14 lists these values.

### 3.2.3.2 LBO (Line Build Out)

To prevent the cross-talk at the far end, the output of TTIP/TRING could be attenuated before transmission for long haul applications. The FCC Part 68 Regulations specifies four grades of attenuation with a step of 7.5 dB. Three LBOs are used to implement the pulse attenuation. The PULS[3:0] bits (TCF1, 03H...) are used to select the attenuation grade. Both Table-14 and Table-15 list these values.

### 3.2.3.3 User-Programmable Arbitrary Waveform

When the PULS[3:0] bits are set to '11xx', user-programmable arbitrary waveform generator mode can be used in the corresponding channel. This allows the transmitter performance to be tuned for a wide variety of line condition or special application.

Each pulse shape can extend up to 4 UIs (Unit Interval), addressed by UI[1:0] bits (TCF3, 05H...) and each UI is divided into 16 sub-phases, addressed by the SAMP[3:0] bits (TCF3, 05H...). The pulse amplitude of each phase is represented by a binary byte, within the range from +63 to -63, stored in WDAT[6:0] bits (TCF4, 06H...) in signed magnitude form. The most positive number +63 (D) represents the maximum positive amplitude of the transmit pulse while the most negative number -63 (D) represents the maximum negative amplitude of the transmit pulse. Therefore, up to 64 bytes are used. For each channel, a 64 bytes RAM is available.

There are twelve standard templates which are stored in a local ROM. User can select one of them as reference and make some changes to get the desired waveform.

User can change the wave shape and the amplitude to get the desired pulse shape. In order to do this, firstly, users can choose a set of waveform value from the following twelve tables, which is the most similar to the desired pulse shape. Table-2, Table-3, Table-4, Table-5, Table-6, Table-7, Table-8, Table-9, Table-10, Table-11, Table-12 and Table-13 list the sample data and scaling data of each of the twelve templates. Then modify the corresponding sample data to get the desired transmit pulse shape.

Secondly, through the value of SCAL[5:0] bits increased or decreased by 1, the pulse amplitude can be scaled up or down at the percentage ratio against the standard pulse amplitude if needed. For different pulse shapes, the value of SCAL[5:0] bits and the scaling percentage ratio are different. The following twelve tables list these values.

Do the followings step by step, the desired waveform can be programmed, based on the selected waveform template:

- (1). Select the UI by UI[1:0] bits (TCF3, 05H...)
- (2). Specify the sample address in the selected UI by SAMP [3:0] bits (TCF3, 05H...)
- (3). Write sample data to WDAT[6:0] bits (TCF4, 06H...). It contains the data to be stored in the RAM, addressed by the selected UI and the corresponding sample address.
- (4). Set the RW bit (TCF3, 05H...) to '0' to implement writing data to RAM, or to '1' to implement read data from RAM
- (5). Implement the Read from RAM/Write to RAM by setting the DONE bit (TCF3, 05H...)

Repeat the above steps until all the sample data are written to or read from the internal RAM.

- (6). Write the scaling data to SCAL[5:0] bits (TCF2, 04H...) to scale the amplitude of the waveform based on the selected standard pulse amplitude

When more than one UI is used to compose the pulse template, the overlap of two consecutive pulses could make the pulse amplitude overflow (exceed the maximum limitation) if the pulse amplitude is not set properly. This overflow is captured by DAC\_OV\_IS bit (INTS1, 17H...), and, if enabled by the DAC\_OV\_IM bit (INTM1, 12H...), an interrupt will be generated.

The following tables give all the sample data based on the preset pulse templates and LBOs in detail for reference. For preset pulse templates and LBOs, scaling up/down against the pulse amplitude is not supported.

15	0110100	0011110	0001000	0000011
16	0110100	0011100	0001000	0000010

SCAL[5:0] = 000100 (default), One step change of this value of SCAL[5:0] results in 25% scaling up/down against the pulse amplitude.

### 3.2.4 TRANSMIT PATH LINE INTERFACE

The transmit line interface consists of TTIPn pin and TRINGn pin. The impedance matching can be realized by the internal impedance matching circuit or the external impedance matching circuit. If T\_TERM[2] is set to '0', the internal impedance matching circuit will be selected. In this case, the T\_TERM[1:0] bits (TERM, 1AH...) can be set to choose 75 Ω, 100 Ω, 110 Ω or 120 Ω internal impedance of TTIPn/TRINGn. If T\_TERM[2] is set to '1', the internal impedance matching circuit will be disabled. In this case, the external impedance matching circuit will be used to realize the impedance matching. For T1/J1 mode, the external impedance matching circuit for the transmitter is not supported. Figure-9 shows the appropriate external components to connect with the cable for one channel. Table-14 is the list

of the recommended impedance matching for transmitter.

The TTIPn/TRINGn can be turned into high impedance globally by pulling THZ pin to high or individually by setting the THZ bit (TCF1, 03H...) to '1'. In this state, the internal transmit circuits are still active.

Besides, in the following cases, TTIPn/TRINGn will also become high impedance:

- Loss of MCLK: all TTIPn/TRINGn pins become high impedance;
- Loss of TCLKn: corresponding TTIPn/TRINGn become HZ (exceptions: Remote Loopback; Transmit internal pattern by MCLK);
- Transmit path power down;
- After software reset; pin reset and power on.

Table-14 Impedance Matching for Transmitter

Cable Configuration	Internal Termination			External Termination		
	T_TERM[2:0]	PULS[3:0]	R <sub>T</sub>	T_TERM[2:0]	PULS[3:0]	R <sub>T</sub>
E1/75 Ω	000	0000	0 Ω	1XX	0001	9.4 Ω
E1/120 Ω	001	0001			0001	
T1/0~133 ft	010	0010		-	-	-
T1/133~266 ft		0011				
T1/266~399 ft		0100				
T1/399~533 ft		0101				
T1/533~655 ft		0110				
J1/0~655 ft		011				
0 dB LBO	010	1000		-	-	-
-7.5 dB LBO		1001				
-15.0 dB LBO		1010				
-22.5 dB LBO		1011				

Note: The precision of the resistors should be better than ± 1%

### 3.2.5 TRANSMIT PATH POWER DOWN

The transmit path can be powered down individually by setting the T\_OFF bit (TCF0, 02H...) to '1'. In this case, the TTIPn/TRINGn pins are turned into high impedance.

### 3.3 RECEIVE PATH

The receive path consists of Receive Internal Termination, Monitor Gain, Amplitude/Wave Shape Detector, Digital Tuning Controller, Adaptive Equalizer, Data Slicer, CDR (Clock and Data Recovery), Optional Jitter Attenuator, Decoder and LOS/AIS Detector. Refer to Figure-8.

#### 3.3.1 RECEIVE INTERNAL TERMINATION

The impedance matching can be realized by the internal impedance matching circuit or the external impedance matching circuit. If R\_TERM[2] is set to '0', the internal impedance matching circuit will be selected. In this case, the R\_TERM[1:0] bits (TERM, 1AH...) can be set to choose 75 Ω, 100 Ω, 110 Ω or 120 Ω internal impedance of RTIPn/RRINGn. If R\_TERM[2] is set to '1', the internal impedance matching circuit will be disabled. In this case, the external impedance matching circuit will be used to realize the impedance matching.

is set to '0', the internal impedance matching circuit will be selected. In this case, the R\_TERM[1:0] bits (TERM, 1AH...) can be set to choose 75 Ω, 100 Ω, 110 Ω or 120 Ω internal impedance of RTIPn/RRINGn. If R\_TERM[2] is set to '1', the internal impedance matching circuit will be disabled. In this case, the external impedance matching circuit will be used to realize the impedance matching.

Figure-9 shows the appropriate external components to connect with the cable for one channel. Table-15 is the list of the recommended impedance matching for receiver.

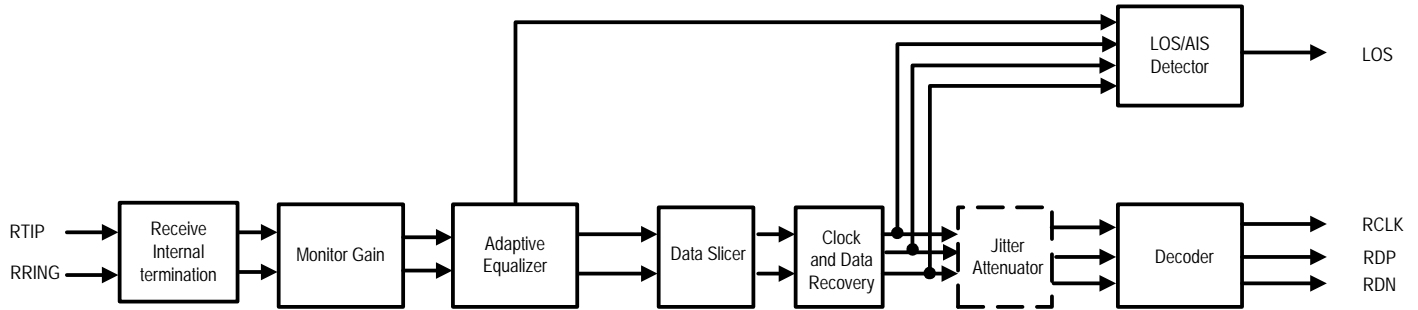

Figure-8 Receive Path Function Block Diagram

Table-15 Impedance Matching for Receiver

Cable Configuration	Internal Termination		External Termination	
	R_TERM[2:0]	R <sub>R</sub>	R_TERM[2:0]	R <sub>R</sub>
E1/75 Ω	000	120 Ω	1XX	75 Ω
E1/120 Ω	001			120 Ω
T1	010			100 Ω
J1	011			110 Ω

- Note: 1. Common decoupling capacitor  
 2. Cp 0-560 (pF)  
 3. D1 - D8, Motorola - MBR0540T1; International Rectifier - 11DQ04 or 10BQ060

Figure-9 Transmit/Receive Line Circuit

### 3.3.2 LINE MONITOR

In both T1/J1 and E1 short haul applications, the non-intrusive monitoring on channels located in other chips can be performed by tapping the monitored channel through a high impedance bridging circuit. Refer to [Figure-10](#) and [Figure-11](#).

After a high resistance bridging circuit, the signal arriving at the RTIPn/RRINGn is dramatically attenuated. To compensate this attenuation, the Monitor Gain can be used to boost the signal by 22 dB, 26 dB and 32 dB, selected by MG[1:0] bits (RCF2, 09H...). For normal operation, the Monitor Gain should be set to 0 dB.

**Figure-10 Monitoring Receive Line in Another Chip**

**Figure-11 Monitor Transmit Line in Another Chip**

### 3.3.3 ADAPTIVE EQUALIZER

The adaptive equalizer can remove most of the signal distortion due to intersymbol interference caused by cable attenuation. It can be enabled or disabled by setting EQ\_ON bit to '1' or '0' (RCF1, 08H...).

When the adaptive equalizer is out of range, EQ\_S bit (STAT0, 14H...) will be set to '1' to indicate the status of equalizer. If EQ\_IES bit (INTES, 13H...) is set to '1', any changes of EQ\_S bit will generate an interrupt and EQ\_IS bit (INTS0, 16H...) will be set to '1' if it is not masked. If EQ\_IES bit is set to '0', only the '0' to '1' transition of the EQ\_S bit will generate an interrupt and EQ\_IS bit will be set to '1' if it is not masked. The EQ\_IS bit will be reset after being read.

The Amplitude/wave shape detector keeps on measuring the amplitude/wave shape of the incoming signals during an observation period. This observation period can be 32, 64, 128 or 256 symbol periods, as selected

by UPDW[1:0] bits (RCF2, 09H...). A shorter observation period allows quicker response to pulse amplitude variation while a longer observation period can minimize the possible overshoots. The default observation period is 128 symbol periods.

Based on the observed peak value for a period, the equalizer will be adjusted to achieve a normalized signal. LATT[4:0] bits (STAT1, 15H...) indicate the signal attenuation introduced by the cable in approximately 2 dB per step.

### 3.3.4 RECEIVE SENSITIVITY

For short haul application, the Receive Sensitivity for both E1 and T1/J1 is -10 dB. For long haul application, the receive sensitivity is -43 dB for E1 and -36 dB for T1/J1.

### 3.3.5 DATA SLICER

The Data Slicer is used to generate a standard amplitude mark or a space according to the amplitude of the input signals. The threshold can be 40%, 50%, 60% or 70%, as selected by the SLICE[1:0] bits (RCF2, 09H...). The output of the Data Slicer is forwarded to the CDR (Clock & Data Recovery) unit or to the RDPn/RDNn pins directly if the CDR is disabled.

### 3.3.6 CDR (Clock & Data Recovery)

The CDR is used to recover the clock from the received signals. The recovered clock tracks the jitter in the data output from the Data Slicer and keeps the phase relationship between data and clock during the absence of the incoming pulse. The CDR can also be by-passed in the Dual Rail mode. When CDR is by-passed, the data from the Data Slicer is output to the RDPn/RDNn pins directly.

### 3.3.7 DECODER

In T1/J1 applications, the R\_MD[1:0] bits (RCF0, 07H...) is used to select the AMI decoder or B8ZS decoder. In E1 applications, the R\_MD[1:0] bits (RCF0, 07H...) are used to select the AMI decoder or HDB3 decoder.

### 3.3.8 RECEIVE PATH SYSTEM INTERFACE

The receive path system interface consists of RCLKn pin, RDn/RDPn pin and RDNn pin. In E1 mode, the RCLKn outputs a recovered 2.048 MHz clock. In T1/J1 mode, the RCLKn outputs a recovered 1.544 MHz clock. The received data is updated on the RDn/RDPn and RDNn pins on the active edge of RCLKn. The active edge of RCLKn can be selected by the RCLK\_SEL bit (RCF0, 07H...). And the active level of the data on RDn/RDPn and RDNn can also be selected by the RD\_INV bit (RCF0, 07H...).

The received data can be output to the system side in two different ways: Single Rail or Dual Rail, as selected by R\_MD bit [1] (RCF0, 07H...). In Single Rail mode, only RDn pin is used to output data and the RDNn/CVn pin is used to report the received errors. In Dual Rail Mode, both RDPn pin and RDNn pin are used for outputting data.

In the receive Dual Rail mode, the CDR unit can be by-passed by setting R\_MD[1:0] to '11' (binary). In this situation, the output data from the Data Slicer will be output to the RDPn/RDNn pins directly, and the RCLKn outputs the exclusive OR (XOR) of the RDPn and RDNn.

### 3.3.9 RECEIVE PATH POWER DOWN

The receive path can be powered down individually by setting R\_OFF bit (RCF0, 07H...) to '1'. In this case, the RCLKn, RDn/RDPn, RDPn and LOSn will be logic low.

3.3.10 G.772 NON-INTRUSIVE MONITORING

In applications using only seven channels, channel 1 can be configured to monitor the data received or transmitted in any one of the remaining channels. The MON[3:0] bits (GCF1, 60H) determine which channel and which direction (transmit/receive) will be monitored. The monitoring is non-intrusive per ITU-T G.772. Figure-12 illustrates the concept.

The monitored line signal (transmit or receive) goes through Channel 1's Clock and Data Recovery. The signal can be observed digitally at the RCLK1, RD1/RDP1 and RDN1. If Channel 1 is configured to Remote Loopback while in the Monitoring mode, the monitored data will be output on TTIP1/TRING1.

Figure-12 G.772 Monitoring Diagram

### 3.4 JITTER ATTENUATOR

There is one Jitter Attenuator in each channel of the LIU. The Jitter Attenuator can be deployed in the transmit path or the receive path, and can also be disabled. This is selected by the JACF[1:0] bits (JACF, 01H...).

#### 3.4.1 JITTER ATTENUATION FUNCTION DESCRIPTION

The Jitter Attenuator is composed of a FIFO and a DPLL, as shown in Figure-13. The FIFO is used as a pool to buffer the jittered input data, then the data is clocked out of the FIFO by a de-jittered clock. The depth of the FIFO can be 32 bits, 64 bits or 128 bits, as selected by the JADP[1:0] bits (JACF, 01H...). Consequently, the constant delay of the Jitter Attenuator will be 16 bits, 32 bits or 64 bits. Deeper FIFO can tolerate larger jitter, but at the expense of increasing data latency time.

Figure-13 Jitter Attenuator

In E1 applications, the Corner Frequency of the DPLL can be 0.9 Hz or 6.8 Hz, as selected by the JABW bit (JACF, 01H...). In T1/J1 applications, the Corner Frequency of the DPLL can be 1.25 Hz or 5.00 Hz, as selected by the JABW bit (JACF, 01H...). The lower the Corner Frequency is, the longer time is needed to achieve synchronization.

When the incoming data moves faster than the outgoing data, the FIFO will overflow. This overflow is captured by the JAOV\_IS bit (INTS1, 17H...). If the incoming data moves slower than the outgoing data, the FIFO will underflow. This underflow is captured by the JAUD\_IS bit (INTS1, 17H...). For some applications that are sensitive to data corruption, the JA limit mode can be enabled by setting JA\_LIMIT bit (JACF, 01H...) to '1'. In the JA limit mode, the speed of the outgoing data will be adjusted automatically when the FIFO is close to its full or emptiness. The criteria of starting speed adjustment are shown in Table-16. The JA limit mode can reduce the possibility of FIFO overflow and underflow, but the quality of jitter attenuation is deteriorated.

#### 3.4.2 JITTER ATTENUATOR PERFORMANCE

The performance of the Jitter Attenuator in the IDT82V2088 meets the ITU-TI.431, G.703, G.736-739, G.823, G.824, ETSI 300011, ETSI TBR12/13, AT&T TR62411 specifications. Details of the Jitter Attenuator performance is shown in Table-69 Jitter Tolerance and Table-70 Jitter Attenuator Characteristics.

Table-16 Criteria of Starting Speed Adjustment

FIFO Depth	Criteria for Adjusting Data Outgoing Speed
32 Bits	2 bits close to its full or emptiness
64 Bits	3 bits close to its full or emptiness
128 Bits	4 bits close to its full or emptiness

### 3.5 LOS AND AIS DETECTION

#### 3.5.1 LOS DETECTION

The Loss of Signal Detector monitors the amplitude of the incoming signal level and pulse density of the received signal on RTIPn and RRINGn.

- **LOS declare (LOS=1)**

A LOS is detected when the incoming signal has “no transitions”, i.e., when the signal level is less than Q dB below nominal for N consecutive pulse intervals. Here N is defined by LAC bit (MAINT0, 0AH...). LOS will be declared by pulling LOSn pin to high (LOS=1) and LOS interrupt will be generated if it is not masked.

- **LOS clear (LOS=0)**

The LOS is cleared when the incoming signal has “transitions”, i.e., when the signal level is greater than P dB below nominal and has an average pulse density of at least 12.5% for M consecutive pulse intervals, starting with the receipt of a pulse. Here M is defined by LAC bit (MAINT0, 0AH...). LOS status is cleared by pulling LOSn pin to low.

Figure-14 LOS Declare and Clear

- **LOS detect level threshold**

In short haul mode, the amplitude threshold Q is fixed on 800 mVpp, while P=Q+200 mVpp (200 mVpp is the LOS level detect hysteresis).

In long haul mode, the value of Q can be selected by LOS[4:0] bit (RCF1, 08H...), while P=Q+4 dB (4 dB is the LOS level detect hysteresis). The LOS[4:0] default value is 10101 (-46 dB).

- **Criteria for declare and clear of a LOS detect**

The detection supports the ANSI T1.231 and I.431 for T1/J1 mode and G.775 and ETSI 300233/I.431 for E1 mode. The criteria can be selected by LAC bit (MAINT0, 0AH...) and T1E1 bit (GCF0, 40H).

Table-17 and Table-18 summarize LOS declare and clear criteria for both short haul and long haul application.

- **All Ones output during LOS**

On the system side, the RDPn/RDNn will reflect the input pulse “transition” at the RTIPn/RRINGn side and output recovery clock (but the quality of the output clock can not be guaranteed when the input level is lower than the maximum receive sensitivity) when AISE bit (MAINT0, 0AH...) is 0; or output All Ones as AIS when AISE bit (MAINT0, 0AH...) is 1. In this case RCLKn output is replaced by MCLK.

On the line side, the TTIPn/TRINGn will output All Ones as AIS when ATAO bit (MAINT0, 0AH...) is 1. The All Ones pattern uses MCLK as the reference clock.

LOS indicator is always active for all kinds of loopback modes.

Table-17 LOS Declare and Clear Criteria for Short Haul Mode

Control bit		LOS declare threshold	LOS clear threshold
T1E1	LAC		
1=T1/J1	0=T1.231	Level < 800 mVpp N=175 bits	Level > 1 Vpp M=128 bits 12.5% mark density <100 consecutive zeroes
	1=I.431	Level < 800 mVpp N=1544 bits	Level > 1 Vpp M=128 bits 12.5% mark density <100 consecutive zeroes
0=E1	0=G.775	Level < 800 mVpp N=32 bits	Level > 1 Vpp M=32 bits 12.5% mark density <16 consecutive zeroes
	1=I.431/ETSI	Level < 800 mVpp N=2048 bits	Level > 1 Vpp M=32 bits 12.5% mark density <16 consecutive zeroes

Table-18 LOS Declare and Clear Criteria for Long Haul Mode

Control bit				LOS declare threshold	LOS clear threshold	Note
T1E1	LAC	LOS[4:0]	Q (dB)			
1=T1/J1	0	T1.231	00000	-4	Level < Q N=175 bits	Level > Q+ 4dB M=128 bits 12.5% mark density <100 consecutive zeroes

10110-11111	-48					
...	...					

3.5.2 AIS DETECTION

The Alarm Indication Signal can be detected by the IDT82V2088 when the Clock&Data Recovery unit is enabled. The status of AIS detection is reflected in the AIS\_S bit (STAT0, 14H...). In T1/J1 applications, the criteria for declaring/clearing AIS detection are in compliance with the ANSI

T1.231. In E1 applications, the criteria for declaring/clearing AIS detection comply with the ITU G.775 or the ETSI 300233, as selected by the LAC bit (MAINT0, 0AH...). Table-19 summarizes different criteria for AIS detection Declaring/Clearing.

Table-19 AIS Condition

	ITU G.775 for E1 (LAC bit is set to '0' by default)	ETSI 300233 for E1 (LAC bit is set to '1')	ANSI T1.231 for T1/J1
<b>AIS detected</b>	Less than 3 zeros contained in each of two consecutive 512-bit streams are received	Less than 3 zeros contained in a 512-bit stream are received	Less than 9 zeros contained in an 8192-bit stream (a ones density of 99.9% over a period of 5.3ms)
<b>AIS cleared</b>	3 or more zeros contained in each of two consecutive 512-bit streams are received	3 or more zeros contained in a 512-bit stream are received	9 or more zeros contained in an 8192-bit stream are received

### 3.6 TRANSMIT AND DETECT INTERNAL PATTERNS

The internal patterns (All Ones, All Zeros, PRBS/QRSS pattern and Activate/Deactivate Loopback Code) will be generated and detected by the IDT82V2088. TCLKn is used as the reference clock by default. MCLK can also be used as the reference clock by setting the PATT\_CLK bit (MAINT0, 0AH...) to '1'.

If the PATT\_CLK bit (MAINT0, 0AH...) is set to '0' and the PATT[1:0] bits (MAINT0, 0AH...) are set to '00', the transmit path will operate in normal mode.

#### 3.6.1 TRANSMIT ALL ONES

In transmit direction, the All Ones data can be inserted into the data stream when the PATT[1:0] bits (MAINT0, 0AH...) are set to '01'. The transmit data stream is output from TTIPn/TRINGn. In this case, either TCLKn or MCLK can be used as the transmit clock, as selected by the PATT\_CLK bit (MAINT0, 0AH...).

#### 3.6.2 TRANSMIT ALL ZEROS

If the PATT\_CLK bit (MAINT0, 0AH...) is set to '1', the All Zeros will be inserted into the transmit data stream when the PATT[1:0] bits (MAINT0, 0AH...) are set to '00'.

#### 3.6.3 PRBS/QRSS GENERATION AND DETECTION

A PRBS/QRSS will be generated in the transmit direction and detected in the receive direction by IDT82V2088. The QRSS is  $2^{20}-1$  for T1/J1 applications and the PRBS is  $2^{15}-1$  for E1 applications, with maximum zero restrictions according to the AT&T TR62411 and ITU-T O.151.

When the PATT[1:0] bits (MAINT0, 0AH...) are set to '10', the PRBS/QRSS pattern will be inserted into the transmit data stream with the MSB first. The PRBS/QRSS pattern will be transmitted directly or invertedly.

The PRBS/QRSS in the received data stream will be monitored. If the PRBS/QRSS has reached synchronization status, the PRBS\_S bit (STAT0, 14H...) will be set to '1', even in the presence of a logic error rate less than or equal to  $10^{-1}$ . The criteria for setting/clearing the PRBS\_S bit are shown in Table-20.

Table-20 Criteria for Setting/Clearing the PRBS\_S Bit

PRBS/QRSS Detection	6 or less than 6 bit errors detected in a 64 bits hopping window.
PRBS/QRSS Missing	More than 6 bit errors detected in a 64 bits hopping window.

PRBS data can be inverted through setting the PRBS\_INV bit (MAINT0, 0AH...).

Any change of PRBS\_S bit will be captured by PRBS\_IS bit (INTS0, 16H...). The PRBS\_IES bit (INTES, 13H...) can be used to determine whether the '0' to '1' change of PRBS\_S bit will be captured by the PRBS\_IS bit or any changes of PRBS\_S bit will be captured by the PRBS\_IS bit. When the PRBS\_IS bit is '1', an interrupt will be generated if the PRBS\_IM bit (INTM0, 11H...) is set to '1'.

The received PRBS/QRSS logic errors can be counted in a 16-bit counter if the ERR\_SEL [1:0] bits (MAINT6, 10H...) are set to '00'. Refer to Refer to 3.8 ERROR DETECTION/COUNTING AND INSERTION for the operation of the error counter.

### 3.7 LOOPBACK

To facilitate testing and diagnosis, the IDT82V2088 provides four different loopback configurations: Analog Loopback, Digital Loopback, Remote Loopback and Inband Loopback.

#### 3.7.1 ANALOG LOOPBACK

When the ALP bit (MAINT1, 0BH...) is set to '1', the corresponding channel is configured in Analog Loopback mode. In this mode, the transmit signals are looped back to the Receiver Internal Termination in the receive path then output from RCLKn, RDn, RDPn/RDNn. At the same time, the transmit signals are still output to TTIPn/TRINGn in transmit direction. Figure-15 shows the process.

#### 3.7.2 DIGITAL LOOPBACK

When the DLP bit (MAINT1, 0BH...) is set to '1', the corresponding channel is configured in Digital Loopback mode. In this mode, the transmit signals are looped back to the jitter attenuator (if enabled) and decoder in receive path, then output from RCLKn, RDn, RDPn/RDNn. At the same time, the transmit signals are still output to TTIPn/TRINGn in transmit direction. Figure-16 shows the process.

Both Analog Loopback mode and Digital Loopback mode allow the sending of the internal patterns (All Ones, All Zeros, PRBS, etc.) which will overwrite the transmit signals. In this case, either TCLKn or MCLK can be used as the reference clock for internal patterns transmission.

#### 3.7.3 REMOTE LOOPBACK

When the RLP bit (MAINT1, 0BH...) is set to '1', the corresponding channel is configured in Remote Loopback mode. In this mode, the recovered clock and data output from Clock and Data Recovery on the receive path is looped back to the jitter attenuator (if enabled) and Waveform Shaper in transmit path. Figure-17 shows the process.

Figure-15 Analog Loopback

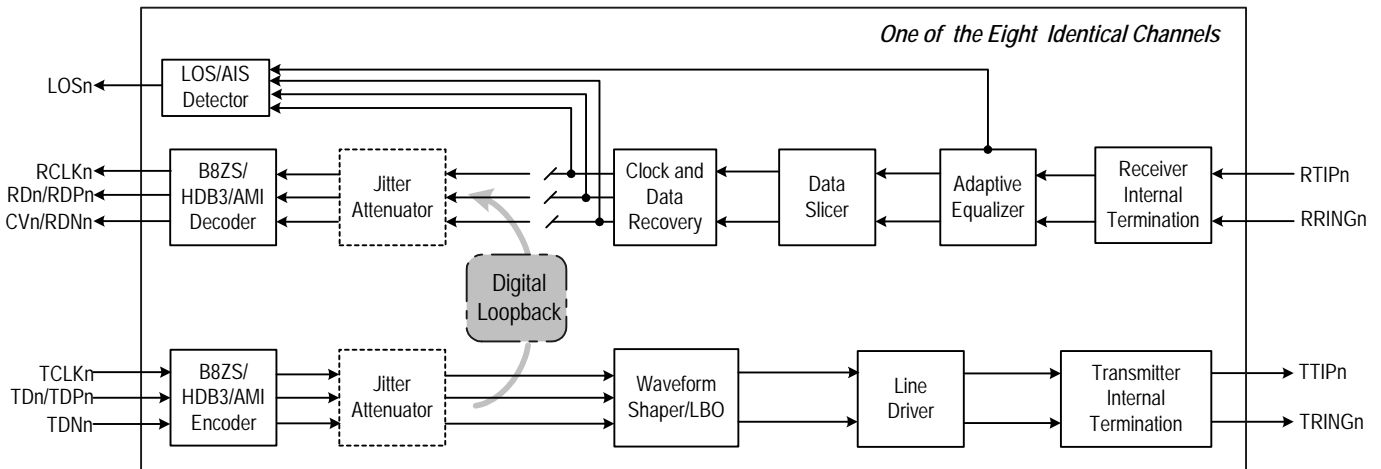

Figure-16 Digital Loopback

Figure-17 Remote Loopback

### 3.7.4 INBAND LOOPBACK

When PATT[1:0] bits (MAINT0, 0AH...) are set to '11', the corresponding channel is configured in Inband Loopback mode. In this mode, an unframed activate/Deactivate Loopback Code is generated repeatedly in transmit direction per ANSI T1. 403 which overwrite the transmit signals. In receive direction, the framed or unframed code is detected per ANSI T1. 403, even in the presence of  $10^{-2}$  bit error rate.

If the Automatic Remote Loopback is enabled by setting ARLP bit (MAINT1, 0BH...) to '1', the chip will establish/demolish the Remote Loopback based on the reception of the Activate Loopback Code/Deactivate Loopback Code for 5.1 s. If the ARLP bit (MAINT1, 0BH...) is set to '0', the Remote Loopback can also be demolished forcibly.

#### 3.7.4.1 Transmit Activate/Deactivate Loopback Code

The pattern of the transmit Activate/Deactivate Loopback Code is defined by the TIBLB[7:0] bits (MAINT3, 0DH...). Whether the code represents an Activate Loopback Code or a Deactivate Loopback Code is judged by the far end receiver. The length of the pattern ranges from 5 bits to 8 bits, as selected by the TIBLB\_L[1:0] bits (MAINT2, 0CH...). The pattern can be programmed to 6-bit-long or 8-bit-long respectively by repeating itself if it is 3-bit-long or 4-bit-long. When the PATT[1:0] bits (MAINT0, 0AH...) are set to '11', the transmission of the Activate/Deactivate Loopback Code is initiated. If the PATT\_CLK bit (MAINT0, 0AH...) is set to '0' and the PATT[1:0] bits (MAINT0, 0AH...) are set to '00', the transmission of the Activate/Deactivate Loopback Code will stop.

The local transmit activate/deactivate code setting should be the same as the receive code setting in the remote end. It is the same thing for the other way round.

#### 3.7.4.2 Receive Activate/Deactivate Loopback Code

The pattern of the receive Activate Loopback Code is defined by the RIBLBA[7:0] bits (MAINT4, 0EH...). The length of this pattern ranges from 5 bits to 8 bits, as selected by the RIBLBA\_L [1:0] bits (MAINT2, 0CH...). The pattern can be programmed to 6-bit-long or 8-bit-long respectively by repeating itself if it is 3-bit-long or 4-bit-long.

The pattern of the receive Deactivate Loopback Code is defined by the RIBLBD[7:0] bits (MAINT5, 0FH...). The length of the receive Deactivate Loopback Code ranges from 5 bits to 8 bits, as selected by the RIBLBD\_L[1:0] bits (MAINT2, 0CH...). The pattern can be programmed to

6-bit-long or 8-bit-long respectively by repeating itself if it is 3-bit-long or 4-bit-long.

After the Activate Loopback Code has been detected in the receive data for more than 30 ms (in E1 mode) / 40 ms (in T1/J1 mode), the IBLBA\_S bit (STAT0, 14H...) will be set to '1' to declare the reception of the Activate Loopback Code.

After the Deactivate Loopback Code has been detected in the receive data for more than 30 ms (in E1 mode) / 40 ms (in T1/J1 mode), the IBLBD\_S bit (STAT0, 14H...) will be set to '1' to declare the reception of the Deactivate Loopback Code.

When the IBLBA\_IES bit (INTES, 13H...) is set to '0', only the '0' to '1' transition of the IBLBA\_S bit will generate an interrupt and set the IBLBA\_IS bit (INTS0, 16H...) to '1'. When the IBLBA\_IES bit is set to '1', any changes of the IBLBA\_S bit will generate an interrupt and set the IBLBA\_IS bit (INTS0, 16H...) to '1'. The IBLBA\_IS bit will be reset to '0' after being read.

When the IBLBD\_IES bit (INTES, 13H...) is set to '0', only the '0' to '1' transition of the IBLBD\_S bit will generate an interrupt and set the IBLBD\_IS bit (INTS0, 16H...) to '1'. When the IBLBD\_IES bit is set to '1', any changes of the IBLBD\_S bit will generate an interrupt and set the IBLBD\_IS bit (INTS0, 16H...) to '1'. The IBLBD\_IS bit will be reset to '0' after being read.

#### 3.7.4.3 Automatic Remote Loopback

When ARLP bit (MAINT1, 0BH...) is set to '1', the corresponding channel is configured into the Automatic Remote Loopback mode. In this mode, if the Activate Loopback Code has been detected in the receive data for more than 5.1 s, the Remote Loopback (shown as Figure-17) will be established automatically, and the RLP\_S bit (STAT1, 15H...) will be set to '1' to indicate the establishment of the Remote Loopback. The IBLBA\_S bit (STAT0, 14H...) is set to '1' to generate an interrupt. In this case, the Remote Loopback mode will still be kept even if the receiver stop receiving the Activate Loopback Code.

If the Deactivate Loopback Code has been detected in the receive data for more than 5.1 s, the Remote Loopback will be demolished automatically, and the RLP\_S bit (STAT1, 15H...) will set to '0' to indicate the demolition of the Remote Loopback. The IBLBD\_S bit (STAT0, 14H...) is set to '1' to generate an interrupt.

The Remote Loopback can also be demolished forcibly by setting ARLP bit (MAINT1, 0BH...) to '0'.

### 3.8 ERROR DETECTION/COUNTING AND INSERTION

#### 3.8.1 DEFINITION OF LINE CODING ERROR

The following line encoding errors can be detected and counted by the IDT82V2088:

- Received Bipolar Violation (BPV) Error: In AMI coding, when two consecutive pulses of the same polarity are received, a BPV error is declared.

- HDB3/B8ZS Code Violation (CV) Error: In HDB3/B8ZS coding, a CV error is declared when two consecutive BPV errors are detected, and the pulses that have the same polarity as the previous pulse are not the HDB3/B8ZS zero substitution pulses.
- Excess Zero (EXZ) Error: there are two standards defining the EXZ errors: ANSI and FCC. The EXZ\_DEF bit (MAINT6, 10H...) chooses which standard will be adopted by the corresponding channel to judge the EXZ error. Table-21 shows definition of EXZ.

Table-21 EXZ Definition

	EXZ Definition	
	ANSI	FCC
AMI	More than 15 consecutive 0s are detected	More than 80 consecutive 0s are detected
HDB3	More than 3 consecutive 0s are detected	More than 3 consecutive 0s are detected
B8ZS	More than 7 consecutive 0s are detected	More than 7 consecutive 0s are detected

#### 3.8.2 ERROR DETECTION AND COUNTING

Which type of the receiving errors (Received CV/BPV errors, excess zero errors and PRBS logic errors) will be counted is determined by ERR\_SEL[1:0] bits (MAINT6, 10H...). Only one type of receiving error can be counted at a time except that when the ERR\_SEL[1:0] bits are set to '11', both CV/BPV and EXZ errors will be detected and counted.

The receiving errors are counted in an internal 16-bit Error Counter. Once an error is detected, an error interrupt which is indicated by corresponding bit in (INTS1, 17H...) will be generated if it is not masked. This Error Counter can be operated in two modes: Auto Report Mode and Manual Report Mode, as selected by the CNT\_MD bit (MAINT6, 10H...). In Single Rail mode, once BPV or CV errors are detected, the CVn pin will be driven to high for one RCLK period.

##### Auto Report Mode

In Auto Report Mode, the internal counter starts to count the received errors when the CNT\_MD bit (MAINT6, 10H...) is set to '1'. A one-second timer is used to set the counting period. The received errors are counted within one second. If the one-second timer expires, the value in the internal counter will be transferred to (CNT0, 18H...) and (CNT1, 19H...), then the internal counter will be reset and start to count received errors for the next second. The errors occurred during the transfer will be accumulated to the next round. The expiration of the one-second timer will set TMOV\_IS bit (INTS1, 17H...) to '1', and will generate an interrupt if the TIMER\_IM bit (INTM1, 12H...) is set to '0'. The TMOV\_IS bit (INTS1, 17H...) will be cleared after the interrupt register is read. The content in the (CNT0, 18H...) and

(CNT1, 19H...) should be read within the next second. If the counter overflows, a counter overflow interrupt which is indicated by CNT\_OV\_IS bit (INTS1, 17H...) will be generated if it is not masked by CNT\_IM bit (INTM1, 12H...).

Figure-18 Auto Report Mode

### • Manual Report Mode

In Manual Report Mode, the internal Error Counter starts to count the received errors when the CNT\_MD bit (MAINT6, 10H...) is set to '0'. When there is a '0' to '1' transition on the CNT\_TRF bit (MAINT6, 10H...), the data in the counter will be transferred to (CNT0, 18H...) and (CNT1, 19H...), then the counter will be reset. The errors occurred during the transfer will be accumulated to the next round. If the counter overflows, a counter overflow interrupt indicated by CNT\_OV\_IS bit (INTS1, 17H...) will be generated if it is not masked by CNT\_IM bit (INTM1, 12H...).

**Figure-19 Manual Report Mode**

Note: 1. It is recommended that users should do the followings within next round of error counting: Read the data in CNT0 and CNT1; Reset CNT\_TRF bit for the next '0' to '1' transition on this bit.

### 3.8.3 BIPOLAR VIOLATION AND PRBS ERROR INSERTION

Only when three consecutive '1's are detected in the transmit data stream, will a '0' to '1' transition on the BPV\_INS bit (MAINT6, 10H...) generate a bipolar violation pulse, and the polarity of the second '1' in the series will be inverted.

A '0' to '1' transition on the EER\_INS bit (MAINT6, 10H...) will generate a logic error during the PRBS/QRSS transmission.

### 3.9 LINE DRIVER FAILURE MONITORING

The transmit driver failure monitor can be enabled or disabled by setting DFM\_OFF bit (TCF1, 03H...). If the transmit driver failure monitor is enabled, the transmit driver failure will be captured by DF\_S bit (STAT0, 14H...). The transition of the DF\_S bit is reflected by DF\_IS bit (INTS0, 16H...), and, if enabled by DF\_IM bit (INTM0, 11H...), will generate an interrupt. When there is a short circuit on the TTIPn/TRINGn port, the output current will be limited to 100 mA (typical) and an interrupt will be generated.

### 3.10 MCLK AND TCLK

#### 3.10.1 MASTER CLOCK (MCLK)

MCLK is an independent, free-running reference clock. MCLK is 1.544 MHz or 37.056 MHz for T1/J1 applications and 2.048 MHz or 49.152 MHz in E1 mode. This reference clock is used to generate several internal reference signals:

- Timing reference for the integrated clock recovery unit.
- Timing reference for the integrated digital jitter attenuator.
- Timing reference for microcontroller interface.
- Generation of RCLK signal during a loss of signal condition if AIS is enabled.
- Reference clock during a blue alarm Transmit All Ones (TAOS), all zeros, PRBS/QRSS and inband loopback patterns if it is selected as the reference clock. For ATAO and AIS, MCLK is always used as the reference clock.

Figure-20 shows the chip operation status in different conditions of MCLK and TCLKn. The missing of MCLK will set all the eight TTIP/TRING to high impedance state.

#### 3.10.2 TRANSMIT CLOCK (TCLK)

The TCLKn is used to sample the transmit data on TDn/TDPn, TDNn. The active edge of TCLKn can be selected by the TCLK\_SEL bit (TCF0, 02H...). During Transmit All Ones, PRBS/QRSS patterns or Inband Loopback Code, either TCLKn or MCLK can be used as the reference clock. This is selected by the PATT\_CLK bit (MAINT0, 0AH...).

But for Automatic Transmit All Ones and AIS, only MCLK is used as the reference clock and the PATT\_CLK bit is ignored. In Automatic Transmit All Ones condition, the ATAO bit (MAINT0, 0AH) is set to '1'. In AIS condition, the AISE bit (MAINT0, 0AH) is set to '1'.

If TCLKn has been missing for more than 70 MCLK cycles, TCLK\_LOS bit (STAT0, 14H...) will be set, and the corresponding TTIPn/TRINGn will become high impedance if this channel is not used for remote loopback or is not using MCLK to transmit internal patterns (TAOS, All Zeros, PRBS and in-band loopback code). When TCLKn is detected again, TCLK\_LOS bit (STAT0, 14H...) will be cleared. The reference frequency to detect a TCLKn loss is derived from MCLK.

Figure-20 TCLK Operation Flowchart

### 3.11 MICROCONTROLLER INTERFACES

The microcontroller interface provides access to read and write the registers in the device. The chip supports serial processor interface and two kinds of parallel processor interface: Motorola non\_multiplexed mode and Intel non\_multiplexed mode. By pulling pin  $P/\overline{S}$  to low or to High, the microcontroller interface can be set to work in serial mode or in parallel mode respectively. Refer to [7 MICROCONTROLLER INTERFACE TIMING CHARACTERISTICS](#) for details.

#### 3.11.1 PARALLEL MICROCONTROLLER INTERFACE

The interface is compatible with Motorola or Intel microcontroller. Pin  $INT/\overline{MOT}$  is used to select the operating mode of the parallel microcontroller

interface. When pin  $INT/\overline{MOT}$  is pulled to Low, the parallel microcontroller interface is configured for Motorola compatible hosts. When High, it is for Intel compatible microcontrollers.

#### 3.11.2 SERIAL MICROCONTROLLER INTERFACE

The serial interface pins include SCLK, SDI, SDO,  $\overline{CS}$  as well as SCLKE (control pin for the selection of serial clock active edge). By pulling  $P/\overline{S}$  pin to LOW, the device operates in the serial host Mode. In this mode, the registers are programmed through a 24-bit word which contains an 8-bit address byte (A0–A7), a subsequent 8-bit command byte (bit  $R/\overline{W}$ ) and an 8-bit data byte (D0–D7). When bit  $R/\overline{W}$  is '1', data is read out from pin SDO. When bit  $R/\overline{W}$  is '0', data is written into SDI pin. Refer to [Figure-21](#).

**Figure-21 Serial Processor Interface Function Timing**

### 3.12 INTERRUPT HANDLING

All kinds of interrupt of the IDT82V2088 are indicated by the  $\overline{\text{INT}}$  pin. When the INT\_PIN[0] bit (GCF0, 40H) is '0', the  $\overline{\text{INT}}$  pin is open drain active low, with a 10 K $\Omega$  external pull-up resistor. When the INT\_PIN[1:0] bits (GCF0, 40H) are '01', the  $\overline{\text{INT}}$  pin is push-pull active low; when the INT\_PIN[1:0] bits are '10', the  $\overline{\text{INT}}$  pin is push-pull active high.

All the interrupt can be disabled by the INTM\_GLB bit (GCF0, 40H). When the INTM\_GLB bit (GCF0, 40H) is set to '0', an active level on the  $\overline{\text{INT}}$  pin represents an interrupt of the IDT82V2088. The INT\_CH[7:0] bits (INTCH, 80H) should be read to identify which channel(s) generate the interrupt.

The interrupt event is captured by the corresponding bit in the Interrupt Status Register (INTS0, 16H...) or (INTS1, 17H...). Every kind of interrupt can be enabled/disabled individually by the corresponding bit in the register (INTM0, 11H...) or (INTM1, 12H...). Some event is reflected by the corresponding bit in the Status Register (STAT0, 14H...) or (STAT1, 15H...), and the Interrupt Trigger Edge Selection Register can be used to determine how the Status Register sets the Interrupt Status Register.

After the Interrupt Status Register (INTS0, 16H...) or (INTS1, 17H...) is read, the corresponding bit indicating which channel generates the interrupt in the INTCH register (80H) will be reset. Only when all the pending

interrupt is acknowledged through reading the Interrupt Status Registers of all the channels (INTS0, 16H...) or (INTS1, 17H...) will all the bits in the INTCH register (80H) be reset and the  $\overline{\text{INT}}$  pin become inactive.

There are totally fourteen kinds of events that could be the interrupt source for one channel:

- (1).LOS Detected
- (2).AIS Detected
- (3).Driver Failure Detected
- (4).TCLK Loss
- (5).Synchronization Status of PRBS
- (6).PRBS Error Detected
- (7).Code Violation Received
- (8).Excessive Zeros Received
- (9).JA FIFO Overflow/Underflow
- (10).Inband Loopback Code Status
- (11).Equalizer Out of Range
- (12).One-Second Timer Expired
- (13).Error Counter Overflow
- (14).Arbitrary Waveform Generator Overflow

Table-22 is a summary of all kinds of interrupt and their associated Status bit, Interrupt Status bit, Interrupt Trigger Edge Selection bit and Interrupt Mask bit.

Table-22 Interrupt Event

Interrupt Event	Status bit (STAT0, STAT1)	Interrupt Status bit (INTS0, INTS1)	Interrupt Edge Selection bit (INTES)	Interrupt Mask bit (INTM0, INTM1)
LOS Detected	LOS_S	LOS_IS	LOS_IES	LOS_IM
AIS Detected	AIS_S	AIS_IS	AIS_IES	AIS_IM
Driver Failure Detected	DF_S	DF_IS	DF_IES	DF_IM
TCLKn Loss	TCLK_LOS	TCLK_LOS_IS	TCLK_IES	TCLK_IM
Synchronization Status of PRBS/QRSS	PRBS_S	PRBS_IS	PRBS_IES	PRBS_IM
PRBS/QRSS Error		ERR_IS		ERR_IM
Code Violation Received		CV_IS		CV_IM
Excessive Zeros Received		EXZ_IS		EXZ_IM
JA FIFO Overflow		JAOV_IS		JAOV_IM
JA FIFO Underflow		JAUD_IS		JAUD_IM
Equalizer Out of Range	EQ_S	EQ_IS	EQ_IES	EQ_IM
Inband Loopback Activate Code Status	IBLBA_S	IBLBA_IS	IBLBA_IES	IBLBA_IM
Inband Loopback Deactivate Code Status	IBLBD_S	IBLBD_IS	IBLBD_IES	IBLBD_IM
One-Second Timer Expired		TMOV_IS		TIMER_IM
Error Counter Overflow		CNT_OV_IS		CNT_IM
Arbitrary Waveform Generator Overflow		DAC_OV_IS		DAC_OV_IM

### 3.13 GENERAL PURPOSE I/O

The IDT82V2088 provides two general purpose digital I/O pins: GPIO1, GPIO0. These two pins can be considered as digital Input or Output port by the DIR1 bit (GPIO, A0H) and DIR0 bit (GPIO, A0H) respectively. If the GPIO1 and GPIO0 are configured as Input port, the LEVEL1 bit (GPIO, A0H) and the LEVEL0 bit (GPIO, A0H) are used to reflect the level of the GPIO1 pin and the GPIO0 pin respectively. If the GPIO1 and GPIO0 are configured as Output port, the content in the LEVEL1 bit and LEVEL0 bit determines the logic value of GPIO1 pin and GPIO0 pin respectively.

### 3.14 5V TOLERANT I/O PINS

All digital input pins will tolerate  $5.0 \pm 5\%$  volts and are compatible with TTL logic.

### 3.15 RESET OPERATION

The chip can be reset in two ways:

- Software Reset: Writing to the RST register (20H) will reset the chip in 1  $\mu$ s.
- Hardware Reset: Asserting the  $\overline{\text{RST}}$  pin low for a minimum of 100 ns will reset the chip.

After reset, all drivers output are in high impedance state, all the internal flip-flops are reset, and all the registers are initialized to default values.

### 3.16 POWER SUPPLY

This chip uses a single 3.3 V power supply.

## 4 PROGRAMMING INFORMATION

### 4.1 REGISTER LIST AND MAP

The IDT82V2088 registers can be divided into Global Registers and Local Registers. The operation on the Global Registers affects all the eight channels while the operation on Local Registers only affects that specific channel. For different channel, the address of Local Register is different. [Table-23](#) is the map of Global Registers and [Table-24](#) is the map of Local

Registers. If the configuration of all the eight channels is the same, the COPY bit (GCF0, 40H) can be set to '1' to establish the Broadcasting mode. In the Broadcasting mode, the Writing operation on any of the eight channels' registers will be copied to the corresponding registers of all the other channels.

**Table-23 Global Register List and Map**

Address (Hex)	Register	R/W	Map							
			b7	b6	b5	b4	b3	b2	b1	b0

## 4.2 REGISTER DESCRIPTION

### 4.2.1 GLOBAL REGISTERS

Table-25 ID: Chip Revision Register

(R, Address = 00H)

Symbol	Bit	Default	Description
ID[7:0]	7-0	01H	00H is for the first version.

Table-26 RST: Reset Register

(W, Address = 20H)

Symbol	Bit	Default	Description
RST[7:0]	7-0	01H	Software reset. A write operation on this register will reset all internal registers to their default values, and the status of all ports are set to the default status. The content in this register can not be changed.

Table-27 GCF0: Global Configuration Register 0

(R/W, Address = 40H)

Symbol	Bit	Default	Description
-	7-6	0	Reserved
-	5	0	Reserved. For normal operation, this bit should be set to '0'.
T1E1	4	0	This bit selects E1 or T1/J1 operation mode globally. = 0: E1 mode is selected. = 1: T1/J1 mode is selected.
COPY	3	0	Enable broadcasting mode. = 0: Broadcasting mode disabled = 1: Broadcasting mode enabled. Writing operation on one channel's register will be copied exactly to the corresponding registers in all the other channels.
INTM_GLB	2	1	Global interrupt enable = 0: Interrupt is globally enabled. But for each individual interrupt, it still can be disabled by its corresponding Interrupt mask Bit. = 1: All the interrupts are disabled for all channels.
INT_PIN[1:0]	1-0	00	Interrupt pin operation mode selection = x0: open drain, active low (with an external pull-up resistor) = 01: push-pull, active low = 11: push-pull, active high

**Table-28 GCF1: Global Configuration Register 1**  
(R/W, Address = 60H)

Symbol	Bit	Default	Description
MON[3:0]	7-4	0000	MON selects the transmitter or receiver channel to be monitored. = 0000: receiver 1 is in normal operation without monitoring = 0001: monitor receiver 2 = 0010: monitor receiver 3 = 0011: monitor receiver 4 = 0100: monitor receiver 5 = 0101: monitor receiver 6 = 0110: monitor receiver 7 = 0111: monitor receiver 8 = 1000: transmitter 1 is in normal operation without monitoring = 1001: monitor transmitter 2 = 1010: monitor transmitter 3 = 1011: monitor transmitter 4 = 1100: monitor transmitter 5 = 1101: monitor transmitter 6 = 1110: monitor transmitter 7 = 1111: monitor transmitter 8
-	3-0	0000	Reserved

**Table-29 INTCH: Interrupt Channel Indication Register**  
(R, Address = 80H)

Symbol	Bit	Default	Description
INT_CH[7:0]	7-0	00H	INT_CH[n]=1 indicates that an interrupt was generated by channel [n+1] respectively.

**Table-30 GPIO: General Purpose IO Pin Definition Register**  
(R/W, Address = A0H)

Symbol	Bit	Default	Description
-	7-4	0000	Reserved.
LEVEL1	3	-	When GPIO1 is defined as an output port, this bit determines the output level on GPIO1 pin. = 0: low level output on port GPIO1 = 1: high level output on port GPIO1 When GPIO1 is defined as an input port, this bit reflects the input level of GPIO1 pin. = 0: low level input on port GPIO1 = 1: high level input on port GPIO1
LEVEL0	2	-	When GPIO0 is defined as an output port, this bit determines the output level on GPIO0 pin. = 0: low level output on port GPIO0 = 1: high level output on port GPIO0 When GPIO0 is defined as an input port, this bit reflects the input level on GPIO0 pin. = 0: low level input on port GPIO0 = 1: high level input on port GPIO0
DIR1	1	1	= 0: port GPIO1 is configured as output port = 1: port GPIO1 is configured as input port
DIR0	0	1	= 0: port GPIO0 is configured as output port = 1: port GPIO0 is configured as input port

## 4.2.2 JITTER ATTENUATION CONTROL REGISTER

Table-31 JACF: Jitter Attenuator Configuration Register

(R/W, Address = 01H,21H,41H,61H,81H,A1H,C1H,E1H)

Symbol	Bit	Default	Description		
-	7-6	00	Reserved		
JA_LIMIT	5	0	Wide Jitter Attenuation bandwidth = 0: normal mode = 1: JA limit mode		
JACF[1:0]	4-3	00	Jitter Attenuator configuration = 00/10: JA not used = 01: JA in transmit path = 11: JA in receive path		
JADP[1:0]	2-1	00	Jitter Attenuator depth selection = 00: 128 bits = 01: 64 bits = 10/11: 32 bits		
JABW	0	0	Jitter transfer function bandwidth selection		
			JABW	T1/J1	E1
			0	5 Hz	6.8 Hz
1	1.25 Hz	0.9 Hz			

## 4.2.3 TRANSMIT PATH CONTROL REGISTERS

Table-32 TCF0: Transmitter Configuration Register 0

(R/W, Address = 02H,22H,42H,62H,82H,A2H,C2H,E2H)

Symbol	Bit	Default	Description
-	7-5	000	Reserved
T_OFF	4	0	Transmitter power down enable = 0: Transmitter power up = 1: Transmitter power down and line driver high impedance
TD_INV	3	0	Transmit data invert = 0: data on TDn or TDPn/TDNn is active high = 1: data on TDn or TDPn/TDNn is active low
TCLK_SEL	2	0	Transmit clock edge select = 0: data on TDn or TDPn/TDNn is sampled on the falling edges of TCLKn = 1: data on TDn or TDPn/TDNn is sampled on the rising edges of TCLKn
T_MD[1:0]	1-0	00	Transmitter operation mode control bits which select different stages of transmit data path = 00: enable HDB3/B8ZS encoder and waveform shaper blocks, input on TDn is single rail NRZ data = 01: enable AMI encoder and waveform shaper blocks, input on pin TDn is single rail NRZ data = 1x: encoder is bypassed, dual rail NRZ transmit data input on pin TDPn/TDNn

Table-33 TCF1: Transmitter Configuration Register 1

(R/W, Address = 03H,23H,43H,63H,83H,A3H,C3H,E3H)

Symbol	Bit	Default	Description					
-	7-6	00	Reserved. This bit should be '0' for normal operation.					
DFM_OFF	5	0	Transmit driver failure monitor disable = 0: DFM is enabled = 1: DFM is disabled					
THZ	4	1	Transmit line driver high impedance enable = 0: normal state = 1: transmit line driver high impedance enable (other transmit path still in normal state)					
PULS[3:0]	3-0	0000	These bits select the transmit template/LBO for short-haul/long-haul applications.					
				T1/E1/J1	TCLK	Cable Impedance	Cable Range or LBO	Cable Loss
			0000 <sup>1</sup>	E1	2.048 MHz	75 Ω	-	0~43 dB (default)
			0001	E1	2.048 MHz	120 Ω	-	0~43 dB
			0010	DSX1	1.544 MHz	100 Ω	0~133 ft	0~0.6 dB
			0011	DSX1	1.544 MHz	100 Ω	133~266 ft	0.6~1.2 dB
			0100	DSX1	1.544 MHz	100 Ω	266~399 ft	1.2~1.8 dB
			0101	DSX1	1.544 MHz	100 Ω	399~533 ft	1.8~2.4 dB
			0110	DSX1	1.544 MHz	100 Ω	533~655 ft	2.4~3.0 dB
			0111	J1	1.544 MHz	110 Ω	0~655 ft	0~3.0 dB
			1000	DS1	1.544 MHz	100 Ω	0 dB LBO	0~36 dB
			1001	DS1	1.544 MHz	100 Ω	-7.5 dB LBO	0~28.5 dB
			1010	DS1	1.544 MHz	100 Ω	-15 dB LBO	0~21 dB
			1011	DS1	1.544 MHz	100 Ω	-22.5 dB LBO	0~13.5 dB
11xx	User programmable waveform setting							

1. In internal impedance matching mode, for E1/75 Ω cable impedance, the PULS[3:0] bits (TCF1, 03H...) should be set to '0000'. In external impedance matching mode, for E1/75 Ω cable impedance, the PULS[3:0] bits should be set to '0001'.

Table-34 TCF2: Transmitter Configuration Register 2

(R/W, Address = 04H,24H,44H,64H,84H,A4H,C4H,E4H)

Symbol	Bit	Default	Description
-	7-6	00	Reserved
SCAL[5:0]	5-0	100001	SCAL specifies a scaling factor to be applied to the amplitude of the user-programmable arbitrary pulses which is to be transmitted if needed. The default value of SCAL[5:0] is '100001'. Refer to <a href="#">3.2.3.3 User-Programmable Arbitrary Waveform</a> .  = 110110: default value for T1 0~133 ft, T1 133~266 ft, T1 266~399 ft, T1 399~533 ft, T1 533~655 ft, J1 0~655 ft, DS1 0dB LBO. One step change of this value results in 2% scaling up/down against the pulse amplitude. = 010001: default value for DS1 -7.5 dB LBO. One step change of this value results in 6.25% scaling up/down against the pulse amplitude. = 001000: default value for DS1 -15.0 dB LBO. One step change of this value results in 12.5% scaling up/down against the pulse amplitude. = 000100: default value for DS1 -22.5 dB LBO. One step change of this value results in 25% scaling up/down against the pulse amplitude. = 100001: default value for E1 75 Ω and 120 Ω. One step change of this value results in 3% scaling up/down against the pulse amplitude.

Table-35 TCF3: Transmitter Configuration Register 3

(R/W, Address = 05H,25H,45H,65H,85H,A5H,C5H,E5H)

Symbol	Bit	Default	Description
DONE	7	0	After '1' is written to this bit, a read or write operation is implemented.
RW	6	0	This bit selects read or write operation = 0: write to RAM = 1: read from RAM
UI[1:0]	5-4	00	These bits specify the unit interval address. There are 4 unit intervals. = 00: UI address is 0 (The most left UI) = 01: UI address is 1 = 10: UI address is 2 = 11: UI address is 3
SAMP[3:0]	3-0	0000	These bits specify the sample address. Each UI has 16 samples. = 0000: sample address is 0 (The most left Sample) = 0001: sample address is 1 = 0010: sample address is 2 ..... = 1110: sample address is 14 = 1111: sample address is 15

Table-36 TCF4: Transmitter Configuration Register 4

(R/W, Address = 06H,26H,46H,66H,86H,A6H,C6H,E6H)

Symbol	Bit	Default	Description
-	7	0	Reserved
WDAT[6:0]	6-0	0000000	In Indirect Write operation, the WDAT[6:0] will be loaded to the pulse template RAM, specifying the amplitude of the Sample. After an Indirect Read operation, the amplitude data of the Sample in the pulse template RAM will be output to the WDAT[6:0].

## 4.2.4 RECEIVE PATH CONTROL REGISTERS

Table-37 RCF0: Receiver Configuration Register 0

(R/W, Address = 07H,27H,47H,67H,87H,A7H,C7H,E7H)

Symbol	Bit	Default	Description

TIMER_IM	1	1	One-Second Timer expiration interrupt mask = 0: One-Second Timer expiration interrupt enabled = 1: One-Second Timer expiration interrupt masked
CNT_IM	0	1	Counter overflow interrupt mask = 0: Counter overflow interrupt enabled = 1: Counter overflow interrupt masked

Table-49 INTES: Interrupt Trigger Edges Select Register

(R/W, Address = 13H,33H, 53H,73H,93H,B3H,D3H,F3H)

Symbol	Bit	Default	Description
EQ_IES	7	0	This bit determines the Equalizer out of range interrupt event. = 0: interrupt event is defined as a '0' to '1' transition of the EQ_S bit in the STAT0 status register = 1: interrupt event is defined as either a '0' to '1' transition or a '1' to '0' transition of the EQ_S bit in the STAT0 status register.
IBLBA_IES	6	0	This bit determines the Inband Loopback Activate Code interrupt event. = 0: interrupt event is defined as a '0' to '1' transition of the IBLBA_S bit in the STAT0 status register = 1: interrupt event is defined as either a '0' to '1' transition or a '1' to '0' transition of the IBLBA_S bit in the STAT0 status register.
IBLBD_IES	5	0	This bit determines the Inband Loopback Deactivate Code interrupt event. = 0: interrupt event is defined as a '0' to '1' transition of the IBLBD_S bit in the STAT0 status register = 1: interrupt event is defined as either a '0' to '1' transition or a '1' to '0' transition of the IBLBD_S bit in the STAT0 status register.
PRBS_IES	4	0	This bit determines the PRBS/QRSS synchronization status interrupt event. = 0: interrupt event is defined as a '0' to '1' transition of the PRBS_S bit in the STAT0 status register = 1: interrupt event is defined as either a '0' to '1' transition or a '1' to '0' transition of the PRBS_S bit in the STAT0 status register.
TCLK_IES	3	0	This bit determines the TCLK Loss interrupt event. = 0: interrupt event is defined as a '0' to '1' transition of the TCLK_LOS bit in the STAT0 status register = 1: interrupt event is defined as either a '0' to '1' transition or a '1' to '0' transition of the TCLK_LOS bit in the STAT0 status register.
DF_IES	2	0	This bit determines the Driver Failure interrupt event. = 0: interrupt event is defined as a '0' to '1' transition of the DF_S bit in the STAT0 status register = 1: interrupt event is defined as either a '0' to '1' transition or a '1' to '0' transition of the DF_S bit in the STAT0 status register.
AIS_IES	1	0	This bit determines the AIS interrupt event. = 0: interrupt event is defined as a '0' to '1' transition of the AIS_S bit in the STAT0 status register = 1: interrupt event is defined as either a '0' to '1' transition or a '1' to '0' transition of the AIS_S bit in the STAT0 status register.
LOS_IES	0	0	This bit determines the LOS interrupt event. = 0: interrupt event is defined as a '0' to '1' transition of the LOS_S bit in the STAT0 status register = 1: interrupt event is defined as either a '0' to '1' transition or a '1' to '0' transition of the LOS_S bit in the STAT0 status register.

## 4.2.7 LINE STATUS REGISTERS

Table-50 STAT0: Line Status Register 0 (real time status monitor)

(R, Address = 14H,34H,54H,74H,94H,B4H,D4H,F4H)

Symbol	Bit	Default	Description
EQ_S	7	0	Equalizer status indication = 0: In range = 1: out of range
IBLBA_S	6	0	Inband Loopback activate code receive status indication = 0: no Inband Loopback activate code is detected = 1: activate code has been detected for more than t ms. Even there is bit error, this bit remains set as long as the bit error rate is less than $10^{-2}$ .  Note1: Automatic remote loopback switching is disabled (ARLP = 0), t = 40 ms. If automatic remote loopback switching is enabled (ARLP = 1), t = 5.1 s. The rising edge of this bit activates the remote loopback operation in local end. Note2: If IBLBA_IM=0 and IBLBA_IES=0, a '0' to '1' transition on this bit will cause an activate code detect interrupt. If IBLBA_IM=0 and IBLBA_IES=1, any changes on this bit will cause an activate code detect interrupt.
IBLBD_S	5	0	Inband Loopback deactivate code receive status indication = 0: no Inband Loopback deactivate code is detected = 1: the Inband Loopback deactivate code has been detected for more than t. Even there is a bit error, this bit remains set as long as the bit error rate is less than $10^{-2}$ .  Note1: Automatic remote loopback switching is disabled (ARLP = 0), t = 40 ms. If automatic remote loopback switching is enabled (ARLP = 1), t = 5.1 s. The rising edge of this bit disables the remote loopback operation. Note2: If IBLBD_IM=0 and IBLBD_IES=0, a '0' to '1' transition on this bit will cause a deactivate code detect interrupt. If IBLBD_IM=0 and IBLBD_IES=1, any changes on this bit will cause a deactivate code detect interrupt.
PRBS_S	4	0	Synchronous status indication of PRBS/QRSS (real time) = 0: $2^{15}-1$ (E1) PRBS or $2^{20}-1$ (T1/J1) QRSS is not detected = 1: $2^{15}-1$ (E1) PRBS or $2^{20}-1$ (T1/J1) QRSS is detected.  Note: If PRBS_IM=0 and PRBS_IES=0, a '0' to '1' transition on this bit will cause a synchronous status detect interrupt. If PRBS_IM=0 and PRBS_IES=1, any changes on this bit will cause a synchronous status detect interrupt.
TCLK_LOS	3	0	TCLKn loss indication = 0: normal = 1: TCLKn pin has not toggled for more than 70 MCLK cycles.  Note: If TCLK_IM=0 and TCLK_IES=0, a '0' to '1' transition on this bit will cause an interrupt. If TCLK_IM=0 and TCLK_IES=1, any changes on this bit will cause an interrupt.

Table-50 STAT0: Line Status Register 0 (real time status monitor) (Continued)

(R, Address = 14H,34H,54H,74H,94H,B4H,D4H,F4H)

Symbol	Bit	Default	Description
DF_S	2	0	Line driver status indication = 0: normal operation = 1: line driver short circuit is detected.  Note: If DF_IM=0 and DF_IES=0, a '0' to '1' transition on this bit will cause an interrupt. If DF_IM=0 and DF_IES=1, any changes on this bit will cause an interrupt.
AIS_S	1	0	Alarm Indication Signal status detection = 0: no AIS signal is detected in the receive path = 1: AIS signal is detected in the receive path  Note: If AIS_IM=0 and AIS_IES=0, a '0' to '1' transition on this bit will cause an interrupt. If AIS_IM=0 and AIS_IES=1, any changes on this bit will cause an interrupt.
LOS_S	0	0	Loss of Signal status detection = 0: Loss of signal on RTIP/RRING is not detected = 1: Loss of signal on RTIP/RRING is detected  Note: If LOS_IM=0 and LOS_IES=0, a '0' to '1' transition on this bit will cause an interrupt. If LOS_IM=0 and LOS_IES=1, any changes on this bit will cause an interrupt.

Table-51 STAT1: Line Status Register 1 (real time status monitor)

(R, Address = 15H,35H, 55H,75H,95H,B5H, D5H, F5H)

Symbol	Bit	Default	Description
-	7-6	00	Reserved
RLP_S	5	0	Indicating the status of Remote Loopback = 0: The remote loopback is inactive. = 1: The remote loopback is active (closed).
LATT[4:0]	4-0	00000	Line Attenuation Indication in dB relative to a 3 V peak pulse level
		00000	0 to 2 dB
		00001	2 to 4 dB
		00010	4 to 6 dB
		00011	6 to 8 dB
		00100	8 to 10 dB

		00111	14 to 16 dB
		01000	16 to 18 dB
		01001	18 to 20 dB
		01010	20 to 22 dB
		01011	22 to 24 dB
		01100	24 to 26 dB
		01101	26 to 28 dB
		01110	28 to 30 dB
		01111	30 to 32 dB
		10000	32 to 34 dB
		10001	34 to 36 dB
		10010	36 to 38 dB
		10011	38 to 40 dB
		10100	40 to 42 dB
		10101	42 to 44 dB
		10110-11111	>44 dB

## 4.2.8 INTERRUPT STATUS REGISTERS

Table-52 INTS0: Interrupt Status Register 0

(this register is reset after a read operation) (R, Address = 16H,36H, 56H,76H,96H,B6H, D6H, F6H)

Symbol	Bit	Default	Description
EQ_IS	7	0	This bit indicates the occurrence of Equalizer out of range interrupt event. = 0: no interrupt event from the Equalizer out of range occurred = 1: interrupt event from the Equalizer out of range occurred
IBLBA_IS	6	0	This bit indicates the occurrence of the Inband Loopback Activate Code interrupt event. = 0: no Inband Loopback Activate Code interrupt event occurred = 1: Inband Loopback Activate Code Interrupt event occurred
IBLBD_IS	5	0	This bit indicates the occurrence of the Inband Loopback Deactivate Code interrupt event. = 0: no Inband Loopback Deactivate Code interrupt event occurred = 1: interrupt event of the received inband loopback deactivate code occurred.
PRBS_IS	4	0	This bit indicates the occurrence of the interrupt event generated by the PRBS/QRSS synchronization status. = 0: no PRBS/QRSS synchronization status interrupt event occurred = 1: PRBS/QRSS synchronization status interrupt event occurred
TCLK_LOS_IS	3	0	This bit indicates the occurrence of the interrupt event generated by the TCLKn loss detection. = 0: no TCLKn loss interrupt event. = 1:TCLKn loss interrupt event occurred.
DF_IS	2	0	This bit indicates the occurrence of the interrupt event generated by the Driver Failure. = 0: no Driver Failure interrupt event occurred = 1: Driver Failure interrupt event occurred
AIS_IS	1	0	This bit indicates the occurrence of the AIS (Alarm Indication Signal) interrupt event. = 0: no AIS interrupt event occurred = 1: AIS interrupt event occurred
LOS_IS	0	0	This bit indicates the occurrence of the LOS (Loss of signal) interrupt event. = 0: no LOS interrupt event occurred = 1: LOS interrupt event occurred

Table-53 INTS1: Interrupt Status Register 1

(this register is reset and relevant interrupt request is cleared after a read) (R, Address = 17H,37H, 57H,77H,97H,B7H, D7H, F7H)

Symbol	Bit	Default	Description
DAC_OV_IS	7	0	This bit indicates the occurrence of the pulse amplitude overflow of Arbitrary Waveform Generator interrupt event. = 0: no pulse amplitude overflow of Arbitrary Waveform Generator interrupt event occurred = 1: the pulse amplitude overflow of Arbitrary Waveform Generator interrupt event occurred
JAOV_IS	6	0	This bit indicates the occurrence of the Jitter Attenuator Overflow interrupt event. = 0: no JA overflow interrupt event occurred = 1: A overflow interrupt event occurred
JAUD_IS	5	0	This bit indicates the occurrence of the Jitter Attenuator Underflow interrupt event. = 0: no JA underflow interrupt event occurred = 1: JA underflow interrupt event occurred
ERR_IS	4	0	This bit indicates the occurrence of the interrupt event generated by the detected PRBS/QRSS logic error. = 0: no PRBS/QRSS logic error interrupt event occurred = 1: PRBS/QRSS logic error interrupt event occurred
EXZ_IS	3	0	This bit indicates the occurrence of the Excessive Zeros interrupt event. = 0: no excessive zeros interrupt event occurred = 1: EXZ interrupt event occurred
CV_IS	2	0	This bit indicates the occurrence of the Code Violation interrupt event. = 0: no code violation interrupt event occurred = 1: code violation interrupt event occurred
TMOV_IS	1	0	This bit indicates the occurrence of the One-Second Timer Expiration interrupt event. = 0: no one-second timer expiration interrupt event occurred = 1: one-second timer expiration interrupt event occurred
CNT_OV_IS	0	0	This bit indicates the occurrence of the Counter Overflow interrupt event. = 0: no counter overflow interrupt event occurred = 1: counter overflow interrupt event occurred

## 4.2.9 COUNTER REGISTERS

Table-54 CNT0: Error Counter L-byte Register 0

(R, Address = 18H,38H, 58H,78H,98H,B8H, D8H, F8H)

Symbol	Bit	Default	Description
CNT_L[7:0]	7-0	00H	This register contains the lower eight bits of the 16-bit error counter. CNT_L[0] is the LSB.

Table-55 CNT1: Error Counter H-byte Register 1

(R, Address = 19H,39H, 59H,79H,99H,B9H,D9H,F9H)

Symbol	Bit	Default	Description
CNT_H[7:0]	7-0	00H	This register contains the upper eight bits of the 16-bit error counter. CNT_H[7] is the MSB.

## 4.2.10 TRANSMIT AND RECEIVE TERMINATION REGISTER

Table-56 TERM: Transmit and Receive Termination Configuration Register

(R/W, Address = 1AH,3AH,5AH,7AH,9AH,BAH,DAH,FAH)

Symbol	Bit	Default	Description
-	7-6	00	Reserved
T_TERM[2:0]	5-3	000	These bits select the internal termination for transmit line impedance matching. = 000: internal 75 $\Omega$ impedance matching = 001: internal 120 $\Omega$ impedance matching = 010: internal 100 $\Omega$ impedance matching = 011: internal 110 $\Omega$ impedance matching = 1xx: Selects external impedance matching resistors for E1 mode only. T1/J1 does not require external impedance resistors (see <a href="#">Table-14</a> ).

## 5 IEEE STD 1149.1 JTAG TEST ACCESS PORT

The IDT82V2088 supports the digital Boundary Scan Specification as described in the IEEE 1149.1 standards.

The boundary scan architecture consists of data and instruction registers plus a Test Access Port (TAP) controller. Control of the TAP is performed through signals applied to the Test Mode Select (TMS) and Test

Clock (TCK) pins. Data is shifted into the registers via the Test Data Input (TDI) pin, and shifted out of the registers via the Test Data Output (TDO) pin. Both TDI and TDO are clocked at a rate determined by TCK.

The JTAG boundary scan registers include BSR (Boundary Scan Register), IDR (Device Identification Register), BR (Bypass Register) and IR (Instruction Register). These will be described in the following pages. Refer to for architecture.

**Figure-22 JTAG Architecture**

## 5.1 JTAG INSTRUCTIONS AND INSTRUCTION REGISTER

The IR (Instruction Register) with instruction decode block is used to select the test to be executed or the data register to be accessed or both.

The instructions are shifted in LSB first to this 3-bit register. See [Table-57](#) for details of the codes and the instructions related.

**Table-57 Instruction Register Description**

IR CODE	INSTRUCTION	COMMENTS
000	Extest	The external test instruction allows testing of the interconnection to other devices. When the current instruction is the EXTEST instruction, the boundary scan register is placed between TDI and TDO. The signal on the input pins can be sampled by loading the boundary scan register using the Capture-DR state. The sampled values can then be viewed by shifting the boundary scan register using the Shift-DR state. The signal on the output pins can be controlled by loading patterns shifted in through input TDI into the boundary scan register using the Update-DR state.
100	Sample / Preload	The sample instruction samples all the device inputs and outputs. For this instruction, the boundary scan register is placed between TDI and TDO. The normal path between IDT82V2088 logic and the I/O pins is maintained. Primary device inputs and outputs can be sampled by loading the boundary scan register using the Capture-DR state. The sampled values can then be viewed by shifting the boundary scan register using the Shift-DR state.
110	Idcode	The identification instruction is used to connect the identification register between TDI and TDO. The device's identification code can then be shifted out using the Shift-DR state.
111	Bypass	The bypass instruction shifts data from input TDI to output TDO with one TCK clock period delay. The instruction is used to bypass the device.

## 5.2 JTAG DATA REGISTER

### 5.2.1 DEVICE IDENTIFICATION REGISTER (IDR)

The IDR can be set to define the producer number, part number and the device revision, which can be used to verify the proper version or revision number that has been used in the system under test. The IDR is 32 bits long and is partitioned as in [Table-58](#). Data from the IDR is shifted out to TDO LSB first.

**Table-58 Device Identification Register Description**

Bit No.	Comments
0	Set to '1'
1-11	Producer Number
12-27	Part Number
28-31	Device Revision

### 5.2.2 BYPASS REGISTER (BR)

The BR consists of a single bit. It can provide a serial path between the TDI input and TDO output, bypassing the BSR to reduce test access times.

### 5.2.3 BOUNDARY SCAN REGISTER (BSR)

The BSR can apply and read test patterns in parallel to or from all the digital I/O pins. The BSR is a 98 bits long shift register and is initialized and read using the instruction EXTEST or SAMPLE/PRELOAD. Each pin is related to one or more bits in the BSR. For details, please refer to the BSDL file.

## 5.2.4 TEST ACCESS PORT CONTROLLER

The TAP controller is a 16-state synchronous state machine. Figure-23 shows its state diagram following the description of each state. Note that the figure contains two main branches to access either the data or instruc-

tion registers. The value shown next to each state transition in this figure states the value present at TMS at each rising edge of TCK. Please refer to Table-59 for details of the state description.

Table-59 TAP Controller State Description

STATE	DESCRIPTION
Test Logic Reset	In this state, the test logic is disabled. The device is set to normal operation. During initialization, the device initializes the instruction register with the IDCODE instruction. Regardless of the original state of the controller, the controller enters the Test-Logic-Reset state when the TMS input is held high for at least 5 rising edges of TCK. The controller remains in this state while TMS is high. The device processor automatically enters this state at power-up.
Run-Test/Idle	This is a controller state between scan operations. Once in this state, the controller remains in the state as long as TMS is held low. The instruction register and all test data registers retain their previous state. When TMS is high and a rising edge is applied to TCK, the controller moves to the Select-DR state.
Select-DR-Scan	This is a temporary controller state and the instruction does not change in this state. The test data register selected by the current instruction retains its previous state. If TMS is held low and a rising edge is applied to TCK when in this state, the controller moves into the Capture-DR state and a scan sequence for the selected test data register is initiated. If TMS is held high and a rising edge applied to TCK, the controller moves to the Select-IR-Scan state.
Capture-DR	In this state, the Boundary Scan Register captures input pin data if the current instruction is EXTEST or SAMPLE/PRELOAD. The instruction does not change in this state. The other test data registers, which do not have parallel input, are not changed. When the TAP controller is in this state and a rising edge is applied to TCK, the controller enters the Exit1-DR state if TMS is high or the Shift-DR state if TMS is low.
Shift-DR	In this controller state, the test data register connected between TDI and TDO as a result of the current instruction shifts data on stage toward its serial output on each rising edge of TCK. The instruction does not change in this state. When the TAP controller is in this state and a rising edge is applied to TCK, the controller enters the Exit1-DR state if TMS is high or remains in the Shift-DR state if TMS is low.
Exit1-DR	This is a temporary state. While in this state, if TMS is held high, a rising edge applied to TCK causes the controller to enter the Update-DR state, which terminates the scanning process. If TMS is held low and a rising edge is applied to TCK, the controller enters the Pause-DR state. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state.
Pause-DR	The pause state allows the test controller to temporarily halt the shifting of data through the test data register in the serial path between TDI and TDO. For example, this state could be used to allow the tester to reload its pin memory from disk during application of a long test sequence. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. The controller remains in this state as long as TMS is low. When TMS goes high and a rising edge is applied to TCK, the controller moves to the Exit2-DR state.
Exit2-DR	This is a temporary state. While in this state, if TMS is held high, a rising edge applied to TCK causes the controller to enter the Update-DR state, which terminates the scanning process. If TMS is held low and a rising edge is applied to TCK, the controller enters the Shift-DR state. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state.
Update-DR	The Boundary Scan Register is provided with a latched parallel output to prevent changes while data is shifted in response to the EXTEST and SAMPLE/PRELOAD instructions. When the TAP controller is in this state and the Boundary Scan Register is selected, data is latched into the parallel output of this register from the shift-register path on the falling edge of TCK. The data held at the latched parallel output changes only in this state. All shift-register stages in the test data register selected by the current instruction retain their previous value and the instruction does not change during this state.
Select-IR-Scan	This is a temporary controller state. The test data register selected by the current instruction retains its previous state. If TMS is held low and a rising edge is applied to TCK when in this state, the controller moves into the Capture-IR state, and a scan sequence for the instruction register is initiated. If TMS is held high and a rising edge is applied to TCK, the controller moves to the Test-Logic-Reset state. The instruction does not change during this state.
Capture-IR	In this controller state, the shift register contained in the instruction register loads a fixed value of '100' on the rising edge of TCK. This supports fault-isolation of the board-level serial test data path. Data registers selected by the current instruction retain their value and the instruction does not change during this state. When the controller is in this state and a rising edge is applied to TCK, the controller enters the Exit1-IR state if TMS is held high, or the Shift-IR state if TMS is held low.
Shift-IR	In this state, the shift register contained in the instruction register is connected between TDI and TDO and shifts data one stage towards its serial output on each rising edge of TCK. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. When the controller is in this state and a rising edge is applied to TCK, the controller enters the Exit1-IR state if TMS is held high, or remains in the Shift-IR state if TMS is held low.
Exit1-IR	This is a temporary state. While in this state, if TMS is held high, a rising edge applied to TCK causes the controller to enter the Update-IR state, which terminates the scanning process. If TMS is held low and a rising edge is applied to TCK, the controller enters the Pause-IR state. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state.

Table-59 TAP Controller State Description (Continued)

STATE	DESCRIPTION
Pause-IR	The pause state allows the test controller to temporarily halt the shifting of data through the instruction register. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state. The controller remains in this state as long as TMS is low. When TMS goes high and a rising edge is applied to TCK, the controller moves to the Exit2-IR state.
Exit2-IR	This is a temporary state. While in this state, if TMS is held high, a rising edge applied to TCK causes the controller to enter the Update-IR state, which terminates the scanning process. If TMS is held low and a rising edge is applied to TCK, the controller enters the Shift-IR state. The test data register selected by the current instruction retains its previous value and the instruction does not change during this state.
Update-IR	The instruction shifted into the instruction register is latched into the parallel output from the shift-register path on the falling edge of TCK. When the new instruction has been latched, it becomes the current instruction. The test data registers selected by the current instruction retain their previous value.

VDDR	Receive Power Supply	3.13	3.3	3.47	V	
TA	Ambient operating temperature	-40	25	85	°C	
Total current dissipation <sup>1,2,3</sup>	E1, 75 Ω Load	50% ones density data	-	460	480	mA
		100% ones density data	-	570	590	
	E1, 120 Ω Load	50% ones density data	-	450	470	mA
		100% ones density data	-	540	560	
	T1, 100 Ω Load	50% ones density data	-	510	530	mA
		100% ones density data	-	710	730	
	J1, 110 Ω Load	50% ones density data	-	440	460	mA
		100% ones density data	-	560	580	

1.Power consumption includes power consumption on device and load. Digital levels are 10% of the supply rails and digital outputs driving a 50 pF capacitive load.

2.Maximum power consumption over the full operating temperature and power supply voltage range.

3.In short haul mode, if internal impedance matching is chosen, E1 75Ω power dissipation values are measured with template PULS[3:0] = 0000; E1 120Ω power dissipation values are measured with template PULS[3:0] = 0001; T1 power dissipation values are measured with template PULS[3:0] = 0110; J1 power dissipation values are measured with template PULS[3:0] = 0111.

Table-62 Power Consumption

Symbol	Parameter	Min	Typ	Max <sup>1,2</sup>	Unit	
	E1, 3.3 V, 75 $\Omega$ Load	50% ones density data:	-	1520	-	mW
		100% ones density data:	-	1880	2050	
	E1, 3.3 V, 120 $\Omega$ Load	50% ones density data:	-	1490	-	mW
		100% ones density data:	-	1780	1950	
	T1, 3.3 V, 100 $\Omega$ Load <sup>3</sup>	50% ones density data:	-	1680	-	mW
		100% ones density data:	-	2340	2540	
	J1, 3.3 V, 110 $\Omega$ Load	50% ones density data:	-	1450	-	mW
		100% ones density data:	-	1850	2020	

1. Maximum power and current consumption over the full operating temperature and power supply voltage range. Includes all channels.

2. Power consumption includes power absorbed by line load and external transmitter components.

3. T1 is measured with maximum cable length.

Table-63 DC Characteristics

## 7.2 PARALLEL INTERFACE TIMING

Table-73 Non\_multiplexed Motorola Read Timing Characteristics

Symbol	Parameter	Min	Max	Unit
tRC	Read Cycle Time	190		ns
tDW	Valid $\overline{DS}$ Width	180		ns
tRWV	Delay from $\overline{DS}$ to Valid Read Signal		15	ns
tRWH	$R/\overline{W}$ to $\overline{DS}$ Hold Time	65		ns
tAV	Delay from $\overline{DS}$ to Valid Address		15	ns
tADH	Address to $\overline{DS}$ Hold Time	65		ns
tPRD	$\overline{DS}$ to Valid Read Data Propagation Delay		175	ns
tDAZ	Delay from $\overline{DS}$ inactive to data bus High Impedance	5	20	ns
tRecovery	Recovery Time from Read Cycle	5		ns

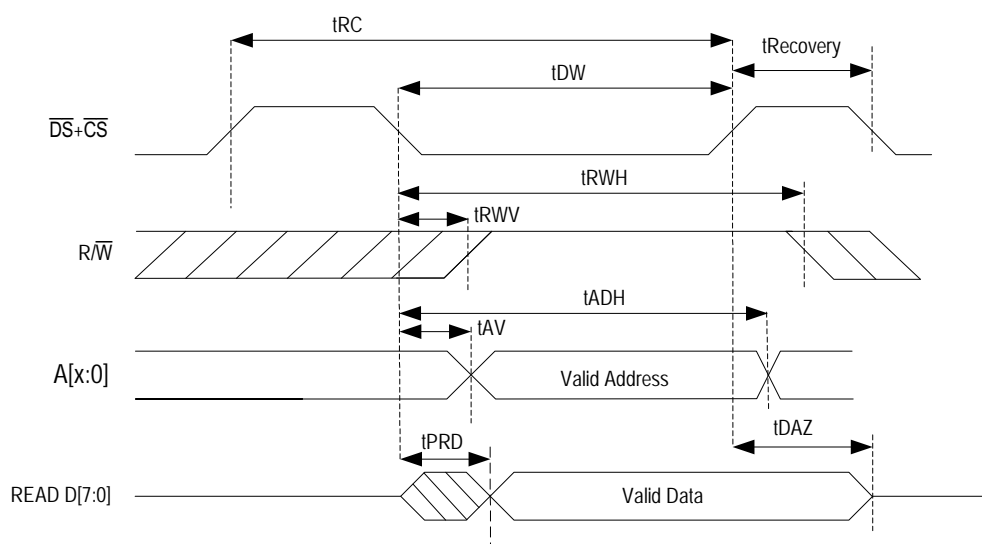

**Figure-34 Non\_multiplexed Motorola Read Timing**

Table-74 Non\_multiplexed Motorola Write Timing Characteristics

Symbol	Parameter	Min	Max	Unit
tWC	Write Cycle Time	120		ns
tDW	Valid $\overline{DS}$ Width	100		ns
tRWV	Delay from $\overline{DS}$ to Valid Write Signal		15	ns
tRWH	$R/\overline{W}$ to $\overline{DS}$ Hold Time	65		ns
tAV	Delay from $\overline{DS}$ to Valid Address		15	ns
tAH	Address to $\overline{DS}$ Hold Time	65		ns
tDV	Delay from $\overline{DS}$ to Valid Write Data		15	ns
tDHW	Write Data to $\overline{DS}$ Hold Time	65		ns
tRecovery	Recovery Time from Write Cycle	5		ns

Figure-35 Non\_multiplexed Motorola Write Timing

Table-75 Non\_multiplexed Intel Read Timing Characteristics

Symbol	Parameter	Min	Max	Unit
tRC	Read Cycle Time	190		ns
tRDW	Valid $\overline{RD}$ Width	180		ns
tAV	Delay from $\overline{RD}$ to Valid Address		15	ns
tAH	Address to $\overline{RD}$ Hold Time	65		ns
tPRD	$\overline{RD}$ to Valid Read Data Propagation Delay		175	ns
tDAZ	Delay from $\overline{RD}$ inactive to data bus High Impedance	5	20	ns
tRecovery	Recovery Time from Read Cycle	5		ns

Note:  $\overline{WR}$  should be tied to high

**Figure-36 Non\_multiplexed Intel Read Timing**

Table-76 Non\_multiplexed Intel Write Timing Characteristics

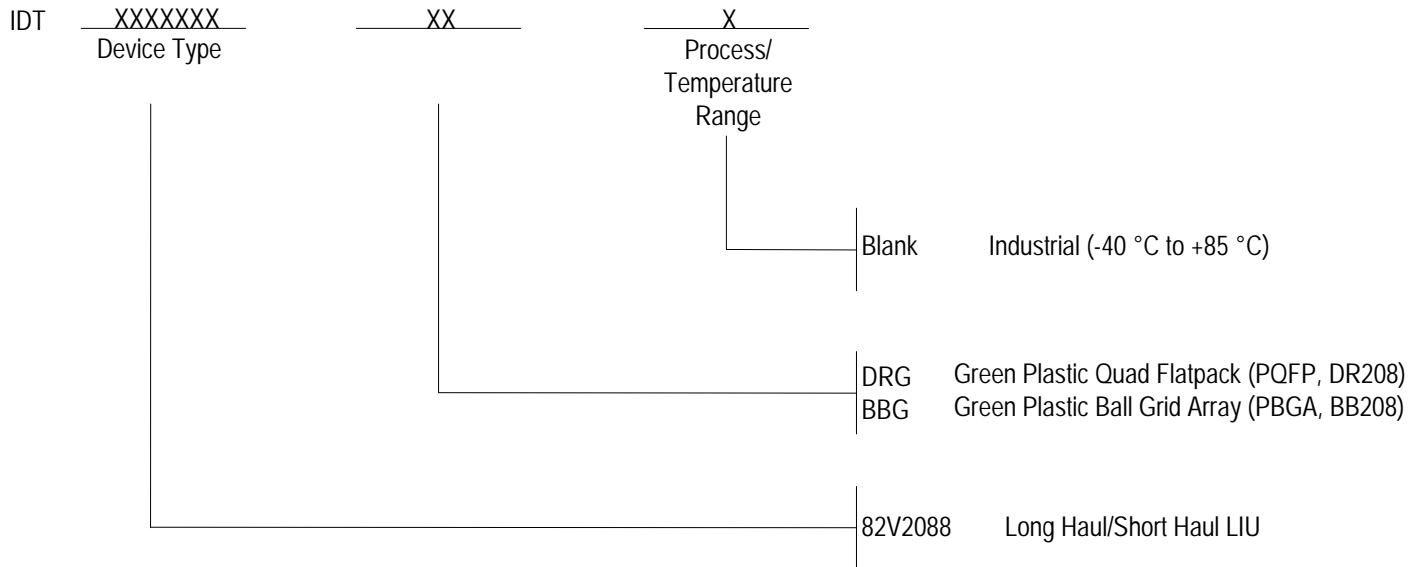

Symbol	Parameter	Min	Max	Unit
tWC	Write Cycle Time	120		ns
tWRW	Valid $\overline{WR}$ Width	100		ns
tAV	Delay from $\overline{WR}$ to Valid Address		15	ns
tAH	Address to $\overline{WR}$ Hold Time	65		ns
tDV	Delay from $\overline{WR}$ to Valid Write Data		15	ns
tDHW	Write Data to $\overline{WR}$ Hold Time	65		ns
tRecovery	Recovery Time from Write Cycle	5		ns

Note:  $\overline{RD}$  should be tied to high

## ORDERING INFORMATION

## DATASHEET DOCUMENT HISTORY

06/26/2003 pgs. 18, 19, 30, 31, 35, 43, 61, 62.

08/22/2003 pgs. 19, 20.

07/19/2004 pgs. 32, 65, 66.

11/27/2012 pg. 78 (updated ordering information)

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
  - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
  - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.

(Rev.4.0-1 November 2017)
