

Serially Programmable Frequency Generator

General Description

The AV9110 generates user specified clock frequencies using an externally generated input reference, such as 14.318 MHz or 10.00 MHz crystal connected between pins 1 and 14. Alternately, a TTL input reference clock signal can be used. The output frequency is determined by a 24-bit digital word entered through the serial port. The serial port enables the user to change the output frequency on-the-fly.

The clock outputs utilize CMOS level output buffers that operate up to 130 MHz.

Features

- Complete user programmability of output frequency through serial input data port
- On-chip Phase-Locked Loop for clock generation
- Generates accurate frequencies up to 130 MHz
- Tristate CMOS outputs
- 5 volt power supply
- Low power CMOS technology
- 14-pin DIP or 150-mil SOIC
- Very low jitter
- Wide operating range VCO

Applications

Graphics: The AV9110 generates low jitter, high speed pixel (or dot) clocks. It can be used to replace multiple expensive high speed crystal oscillators. The flexibility of this device allows it to generate nonstandard graphics clocks, allowing the user to program frequencies on-the-fly.

Clock Reference Implementations: AV9110-01 vs. AV9110-02

The AV9110 requires a stable reference clock (5 to 32 MHz) to generate a stable, low jitter output clock. The AV9110-01 is optimized to use an external quartz crystal as a frequency reference, without the need of additional external components. The AV9110-02 is optimized to accept an TTL clock reference. Either device can be used with an external crystal or accept a TTL clock reference, although extra components may be required. The various combinations implied are summarized in Figure 2 (see page 7).

Pin Descriptions

PIN NUMBER	PIN NAME	PIN TYPE	DESCRIPTION
1	X1	Input	Crystal input or TTL reference clock.
2	AVDD	Power	ANALOG power supply. Connect to +5V.
3	AGND	Power	ANALOG GROUND.
4	VDD	Power	Digital power supply. Connect to +5V.
5	GND	Power	Digital GROUND.
6	DATA	Input	Serial DATA pin.
7	SCLK	Input	SERIAL CLOCK. Clocks shift register.
8	CE#	Input	CHIP ENABLE. Active low, controls data transfer.
9	CLK/X	Output	CMOS CLOCK divided by X output.
10	GND	Power	Digital GROUND.
11	VDD	Power	Digital power supply. Connect to +5V.
12	CLK	Output	CMOS CLOCK output.
13	OE	Input	OUTPUT ENABLE. Tristates both outputs when low.
14	X2	Output	Crystal input or TTL reference clock.

Absolute Maximum Ratings

Supply Voltage	7.0 V
Voltage on I/O pins referenced to GND	GND -0.5 V to V _{DD} +0.5 V
Operating Temperature under bias	0°C to +70°C
Power dissipation	0.8 Watts
Storage Temperature	-65°C to +150°C

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. These ratings are stress specifications only and functional operation of the device at these or any other conditions above those listed in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

Electrical Characteristics

V_{DD} = +5V±10%, T_A = 0 – 70°C unless otherwise stated

DC/STATIC						
PARAMETER	SYMBOL	TEST CONDITIONS	MIN	TYP	MAX	UNITS

Skew, Output to Output/X1	t _{skew}		-	400	-	ps

Note 1: Parameter is guaranteed by design and characterization. Not 100% tested in production.

Serial Programming

The AV9110 is programmed to generate clock frequencies by entering data through the shift register. Figure 1 displays the proper timing sequence. On the negative going edge of CE#, the shift register is enabled and the data at the DATA pin is loaded into the shift register on the rising edge of the SCLK. Bit D0 is loaded first, followed by D1, D2, etc. This data consists of the 24 bits shown in the Shift Register Bit Assignment in Table 1, and therefore takes 24 clock cycles to load. An internal counter then disables the input and transfers

the data to internal latches on the rising edge of the 24th cycle of the SCLK. Any data entered after the 24th cycle is ignored until CE# must remain low for a minimum of 24 SCLK clock cycles. If CE# is taken high before 24 clock cycles have elapsed, the data is ignored (no frequency change occurs) and the counter is reset. Tables 1 and 2 display the bit location for generating the output clock frequency and the output divider circuitry, respectively.

BIT	ASSIGNMENT	EQUATION VARIABLE	DEFAULT		BIT
			-01	-02	
0	VCO frequency divider (LSB)	N Integer	1	1	0
1	VCO frequency divider		1	1	1

Programming the PLL

The AV9110 has a wide operating range but it is recommended that it is operated within the following limits:

$2 \text{ MHz} < f_{\text{REF}} < 32 \text{ MHz}$	$f_{\text{REF}} = \text{Input reference frequency}$
$200 \text{ kHz} < \frac{f_{\text{REF}}}{M} < 5 \text{ MHz}$	$M = \text{Reference divide, 3 to 127}$
$50 \text{ MHz} < f_{\text{VCO}} < 250 \text{ MHz}$	$f_{\text{VCO}} = \text{VCO output frequency}$
$f_{\text{VCO}} < 250 \text{ MHz}$	$f_{\text{CLK}} = \text{CLK or CLK/X output frequency}$

The AV9110 is a classical PLL circuit and the VCO output frequency is given by:

$$f_{\text{VCO}} = \frac{N \cdot V \cdot f_{\text{REF}}}{M} \quad \text{Where } \begin{array}{l} N = \text{VCO divided, 3 to 127} \\ M = m \text{ Reference divide, 3 to 127} \\ V = \text{Perscale, 1 or 8} \end{array}$$

The 2 output drivers then give the following frequencies:

$$f_{\text{CLK}} = \frac{f_{\text{VCO}}}{R} = \frac{N \cdot V \cdot f_{\text{REF}}}{M \cdot R} \quad \text{or } f_{\text{REF}} \text{ (output mixable by bit 17)}$$

$$f_{\text{CLK/X}} = \frac{f_{\text{VCO}}}{R \cdot X} = \frac{f_{\text{VCLK}}}{X} \quad \text{Where } R, X = \text{output dividers 1, 2, 4 or 8}$$

Notes:

1. Output frequency accuracy will depend solely on input reference frequency accuracy.
2. For output frequencies below 125 MHz, it is recommended that the VCO output divide, R, should be 2 or greater. This will give improved duty cycle.
3. The minimum output frequency step size is approximately 0.2% due to the divider range provided.

Figure 1 - Serial Programming

AC Timing

Parameter	Minimum time (ns)
t_{su1}	10
t_{su2}	10
t_{h1}	10
t_{h2}	10

Frequency Acquisition Time

Frequency acquisition (or “lock”) time is the time that it takes to change from one frequency to another, and is a function of the difference between the old and new frequencies. The AV9110 can typically lock to within 1% of a new frequency in less than 200 microseconds. This is also true with power-on.

Power-On Reset

Upon power-up the internal latches are preset to provide the following output clock frequencies (14.318 MHz reference assumed):

Device	CLK output	CLK/X output
AV9110-01	25.175 MHz	6.29 MHz
AV9110-02	25.175 MHz	12.59 MHz

These preset default frequencies can be changed with a custom metal mask, as can other attributes.

The actual numbers of these output clock frequencies (14.318MHz reference assumed) are:

Device	CLK output	CLK/X output
AV9110-01	25.255 MHz	6.31 MHz
AV9110-02	25.255 MHz	12.63 MHz

and these are within 0.32%.

Jitter

For high performance applications, the AV9110 offers extremely low jitter and excellent power supply rejection. The one sigma jitter distribution is typically less than ± 125 ps. For optimum performance, the device should be decoupled with both a 2.2mF and a 0.1mF capacitor. Refer to Recommended Board Layout diagram on page 8.

Output Enable

The AV9110 outputs can be disabled with either the OE pin or through serial programming. Setting the OE pin low tristates CLK and CLK/X. Alternatively, setting bits D19 and D20 low in the serial word will tristate the two outputs. Both the OE pin and D19 or D20 must be high to enable an output.

Frequency Transition Glitches

The AV9110 starts changing frequency on the rising edge of the 24th serial clock. If the programming of any output divider is changed, the output clock may glitch before locking to the new frequency in less than 200 μ s with no output glitches (no partial clock cycles).

AV9110 Quartz Crystal Selection

When an external quartz crystal will be used as a frequency reference for the AV9110, attention needs to be given to crystal selection if accurate reference frequency and output frequency is desired. The AV9110 uses a Pierce oscillator design which operates the quartz crystal in parallel-resonant mode. It requires a quartz crystal cut for parallel-resonant operation to ensure an accurate frequency of oscillation (a less expensive series-resonant crystal can be used with the device but it will oscillate approximately 0.1% too fast). The AV9110-01 has internal crystal load capacitors which result in a total crystal load capacitance of approximately 12pF±10%. The AV9110-02 does not have internal load capacitors, but contributes about 3pF load capacitance to the crystal.

Following is a list of recommended crystal devices for the AV9110. They have been tested by the crystal manufacturer to operate suitably with the AV91xx-series crystal oscillator design, having load capacitance characteristics that are compatible with the AV9110-01.

Figure 2 - Clock Reference Combinations

AV9110 Recommended Board Layout

This is the recommended layout for the **AV9110** to maximize clock performance. Shown are the power and ground connections, the ground plane, and the input/output traces.

Use of the isolated ground plane and power connection, as shown, will prevent stray high frequency ground and system noise from coupling to the **AV9110**. As when compared to using the system ground and power planes, this technique will lessen output clock jitter. The isolated ground plane should be connected to the system ground plane at one point near the 2.2mF decoupling cap. For lowest jitter performance, the isolated ground plane should be kept away from clock output pins and traces. Keeping the isolated ground plane area as small as possible will minimize EMI radiation. Use a sufficient gap between the isolated ground plane and system ground plane to prevent AC coupling. The ferrite bead in the VDD line is optional, but will help reduce EMI.

The traces to distribute the output clocks should be over an unbroken system ground or power supply plane. The trace width should be about two times the thickness of the PC board between the trace and the underlying plane. These guidelines help minimize clock jitter and EMI radiation. The traces to distribute power should be as wide as possible.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
