

Description

The 9SBV0802 provides two banks of four 1.05V LVCMOS outputs. Each bank has its own input. There are three OE pins. Two OE pins control two outputs each and one OE pin controls four outputs. One 9SBV0802 allows one PCH to easily support four CPU's with point to point routing of the PM signals. Two 9SBV0802 devices allow one PCH to easily support up to eight CPU's with point-to-point routing of the PM signals.

Features

- 1.8V Power supply, 15mW typical power consumption; eliminate thermal concerns
- OE pins; support 1, 2, 3 or 4 socket systems
- 1.05V LVCMOS inputs with VREF pin; input thresholds matched to chipset power supply
- Space saving 4 × 4mm 20-VFQFPN; minimal board space

Typical Application

Fanout buffer for PM-SYNC and PM_SYNC CLK in Intel Servers

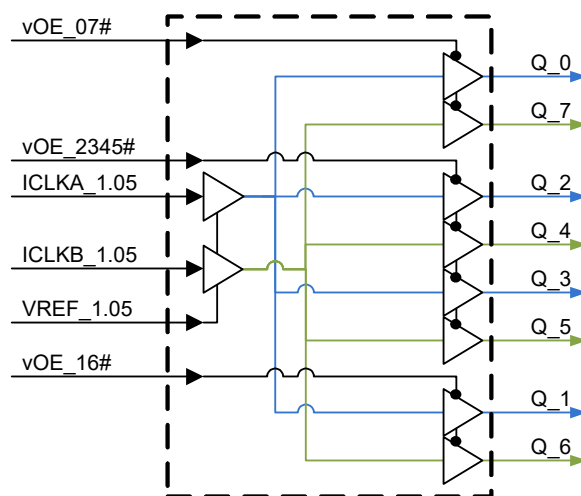

Output Features

- Eight 1–48MHz 1.05V LVCMOS outputs

Key Specifications

- Additive cycle-to-cycle jitter < 8ps
- Output-to-output skew within a bank < 50ps
- Output-to-output skew between banks < 100ps
