

General Description

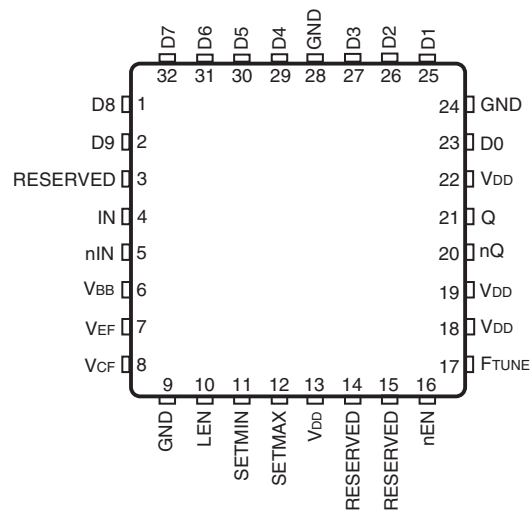

The ICS854S296I-33 is a high performance LVDS Programmable Delay Line. The delay can vary from 2.2ns to 12.5ns in 10ps steps. The ICS854S296I-33 is characterized to operate from a 3.3V power supply and is guaranteed over industrial temperature range.

The delay of the device varies in discrete steps based on a control word. A 10-bit long control word sets the delay in 10ps increments. Also, the input pins IN and nIN default to an equivalent low state when left floating. The control register can accept CMOS or TTL level signals.

Features

- One LVDS level output
- One differential clock input pair
- Differential input clock (IN, nIN) can accept the following signaling levels: LVPECL, LVDS, CML
- Maximum frequency: 1.2GHz
- Programmable Delay Range: 2.2ns to 12.5ns in 10ps steps
- D[9:0] can accept LVPECL, LVCMOS or LVTTTL levels
- Full 3.3V supply voltages
- -40°C to 85°C ambient operating temperature
- Available in lead-free (RoHS 6) package

Pin Description and Pin Characteristic Tables

Table 1. Pin Descriptions

| Number | Name | Type | | Description |
|--------------------------------------|--|--------------|---------------------|--|
| 1, 2, 23, 25, 26, 27, 29, 30, 31, 32 | D8, D9, D0, D1, D2, D3, D4, D5, D6, D7 | Input | Pulldown | Parallel data input D[9:0]. Single-ended LVCMOS, LVTTTL, LVPECL interface levels. |
| 3, 14, 15 | RESERVED | Reserved | | Reserved pins. |
| 4 | IN | Input | Pulldown | Non-inverting LVPECL differential input. |
| 5 | nIN | Input | Pullup/ Pulldown | Inverting LVPECL differential input. |
| 6 | V _{BB} | Output | | Reference voltage output. This pin can be used to rebias AC-coupled inputs to IN and nIN. When used, de-couple to V _{DD} using a 0.01μF capacitor. If not used, leave floating. |
| 7 | V _{EF} | Output | | Reference voltage output. See Table 3C. |
| 8 | V _{CF} | Input | | Reference voltage input. The voltage driven on V _{CF} sets the logic transition threshold for D[9:0]. |
| 9, 24, 28 | GND | Power | | Power supply ground |
| 10 | LEN | Input | Pulldown | D inputs LOAD and HOLD control input. When HIGH, latches the D[9:0] bits. When LOW, the D[9:0] latches are transparent. Single-ended LVPECL interface levels. See Table 3B. |
| 11 | SETMIN | Input | Pulldown | Minimum delay set logic input. When HIGH, D[9:0] registers are reset. When LOW, the delay is set by SETMAX or D[9:0]. Default is LOW when left floating. Single-ended LVPECL interface levels. See Table 3D. |
| 12 | SETMAX | Input | Pulldown | Maximum delay set logic input. When SETMAX is set HIGH and SETMIN is set LOW, D[9:0] = 111111111. When SETMAX is LOW, the delay is set by SETMIN or D[9:0]. Default is low when left floating. Single-ended LVPECL interface levels. See Table 3D. |
| 13, 18, 19, 22 | V _{DD} | Power | | Positive supply pins. |
| 16 | nEN | Input | Pulldown | Single-ended control enable pin. When LOW, Q is delayed from IN. When HIGH, Q is a differential LOW. Default is LOW when left floating. Single-ended LVPECL interface levels. See Table 3A. |
| 17 | F _{TUNE} | Analog Input | | Fine tune delay control input. By varying the input voltage, it provides an additional delay finer than the 10ps digital resolution. |
| 20, 21 | nQ, Q | Output | | Differential output pair. LVDS interface levels. |

NOTE: Pullup and Pulldown refer to internal input resistors. See Table 2, Pin Characteristics, for typical values.

Table 2. Pin Characteristics

| Symbol | Parameter | Test Conditions | Minimum | Typical | Maximum | Units |

Absolute Maximum Ratings

NOTE: Stresses beyond those listed under *Absolute Maximum Ratings* may cause permanent damage to the device. These ratings are stress specifications only. Functional operation of product at these conditions or any conditions beyond those listed in the *DC Characteristics* or *AC Characteristics* is not implied. Exposure to absolute maximum rating conditions for extended periods may affect product reliability.

| Item | Rating |
|--|--------------------------|
| Supply Voltage, V_{DD} | 4.6V |

Recommendations for Unused Input Pins

Inputs:

LVC MOS Control Pins

All control pins have internal pulldown resistors; additional resistance is not required but can be added for additional protection. A 1k Ω resistor can be used.

Wiring the Differential Input to Accept Single-Ended Levels

Figure 1 shows how a differential input can be wired to accept single ended levels. The reference voltage $V_1 = V_{DD}/2$ is generated by the bias resistors R1 and R2. The bypass capacitor (C1) is used to help filter noise on the DC bias. This bias circuit should be located as close to the input pin as possible. The ratio of R1 and R2 might need to be adjusted to position the V_1 in the center of the input voltage swing. For example, if the input clock swing is 2.5V and $V_{DD} = 3.3V$, R1 and R2 value should be adjusted to set V_1 at 1.25V. The values below are for when both the single ended swing and V_{DD} are at the same voltage. This configuration requires that the sum of the output impedance of the driver (R_o) and the series resistance (R_s) equals the transmission line impedance. In addition, matched termination at the input will attenuate the signal in half. This can be done in one of two ways. First, R3 and R4 in parallel should equal the transmission line

impedance. For most 50 Ω applications, R3 and R4 can be 100 Ω . The values of the resistors can be increased to reduce the loading for slower and weaker LVC MOS driver. When using single-ended signaling, the noise rejection benefits of differential signaling are reduced. Even though the differential input can handle full rail LVC MOS signaling, it is recommended that the amplitude be reduced. The datasheet specifies a lower differential amplitude, however this only applies to differential signals. For single-ended applications, the swing can be larger, however V_{IL} cannot be less than -0.3V and V_{IH} cannot be more than $V_{DD} + 0.3V$. Though some of the recommended components might not be used, the pads should be placed in the layout. They can be utilized for debugging purposes. The datasheet specifications are characterized and guaranteed by using a differential signal.

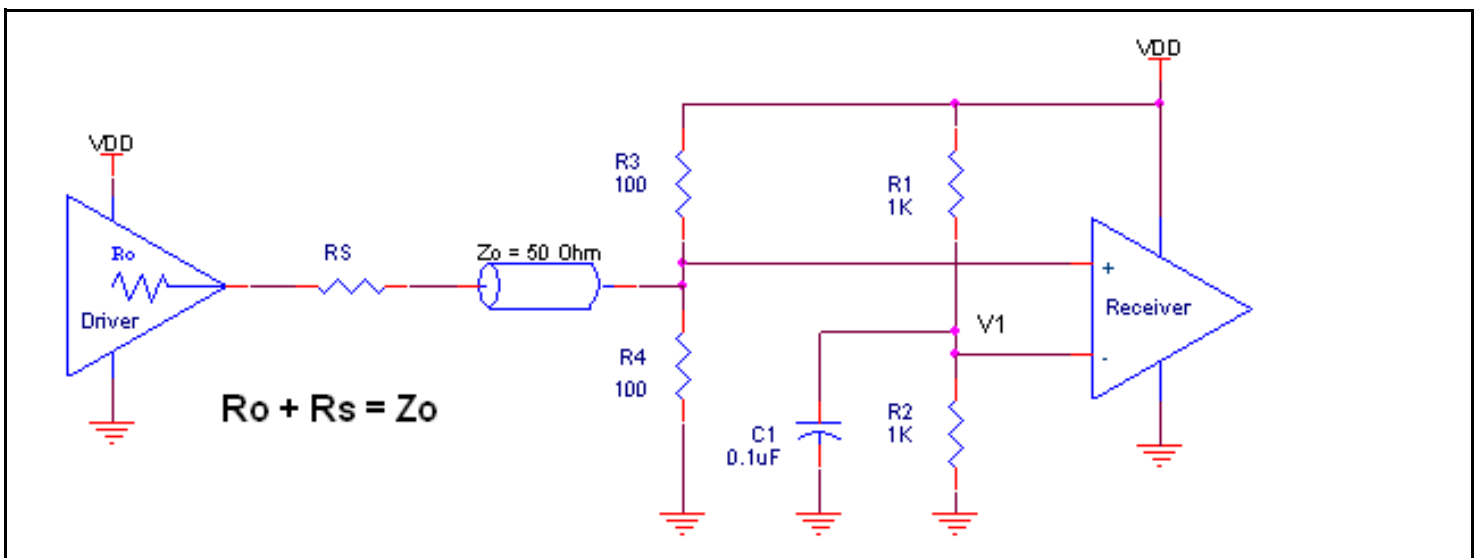

Figure 1. Recommended Schematic for Wiring a Differential Input to Accept Single-ended Levels

LVPECL Clock Input Interface

The IN/nIN accepts LVPECL, CML, LVDS and other differential signals. Both differential signals must meet the V_{PP} and V_{CMR} input requirements. *Figures 2A to 2E* show interface examples for the IN/nIN input driven by the most common driver types. The input

interfaces suggested here are examples only. If the driver is from another vendor, use their termination recommendation. Please consult with the vendor of the driver component to confirm the driver termination requirements.

VFQFN EPAD Thermal Release Path

In order to maximize both the removal of heat from the package and the electrical performance, a land pattern must be incorporated on the Printed Circuit Board (PCB) within the footprint of the package corresponding to the exposed metal pad or exposed heat slug on the package, as shown in *Figure 3*. The solderable area on the PCB, as defined by the solder mask, should be at least the same size/shape as the exposed pad/slug area on the package to maximize the thermal/electrical performance. Sufficient clearance should be designed on the PCB between the outer edges of the land pattern and the inner edges of pad pattern for the leads to avoid any shorts.

While the land pattern on the PCB provides a means of heat transfer and electrical grounding from the package to the board through a solder joint, thermal vias are necessary to effectively conduct from the surface of the PCB to the ground plane(s). The land pattern must be connected to ground through these vias. The vias act as “heat pipes”. The number of vias (i.e. “heat pipes”) are application specific

and dependent upon the package power dissipation as well as electrical conductivity requirements. Thus, thermal and electrical analysis and/or testing are recommended to determine the minimum number needed. Maximum thermal and electrical performance is achieved when an array of vias is incorporated in the land pattern. It is recommended to use as many vias connected to ground as possible. It is also recommended that the via diameter should be 12 to 13mils (0.30 to 0.33mm) with 1oz copper via barrel plating. This is desirable to avoid any solder wicking inside the via during the soldering process which may result in voids in solder between the exposed pad/slug and the thermal land. Precautions should be taken to eliminate any solder voids between the exposed heat slug and the land pattern. Note: These recommendations are to be used as a guideline only. For further information, please refer to the Application Note on the Surface Mount Assembly of Amkor’s Thermally/Electrically Enhance Leadframe Base Package, Amkor Technology.

Figure 3. P.C. Assembly for Exposed Pad Thermal Release Path – Side View (drawing not to scale)

LVDS Driver Termination

For a general LVDS interface, the recommended value for the termination impedance (Z_T) is between 90Ω and 132Ω . The actual value should be selected to match the differential impedance (Z_0) of your transmission line. A typical point-to-point LVDS design uses a 100Ω parallel resistor at the receiver and a 100Ω differential transmission-line environment. In order to avoid any transmission-line reflection issues, the components should be surface mounted and must be placed as close to the receiver as possible. IDT offers a full line of LVDS compliant devices with two types of output structures: current source and voltage source type. The

standard termination schematic as shown in *Figure 4A* can be used with either type of output structure. *Figure 4B*, which can also be used with both output types, is an optional termination with center tap capacitance to help filter common mode noise. The capacitor value should be approximately 50pF . If using a non-standard termination, it is recommended to contact IDT and confirm if the output structure is current source or voltage source type. In addition, since these outputs are LVDS compatible, the input receiver's amplitude and common-mode input range should be verified for compatibility with the output.

LVDS Termination

Schematic Layout

Figure 5 (next page) shows an example ICS854S296I-33 application schematic. The schematic focuses on functional connections and is not configuration specific. Input and output terminations shown are intended as examples only and may not represent the exact user configuration. Refer to the pin description and functional tables in the datasheet to ensure the logic control inputs are properly set.

In this example schematic, the input is driven by a 3.3V LVPECL driver but HCSL or LVDS inputs will work as well. V_{CF} is depicted as a No Connect, which selects LVCMOS levels for pins D[9:0]. D[9:0], nEN, LEN, SETMIN and SETMAX are set by pull up and pull down resistors for compensation of a static delay, the most common application. LEN can be hardwired to a logic low so that D[9:0] pin values are not latched, but instead directly set the internal logic values. This allows pin strapping to avoid the need for an external control of the LEN latch pin.

All the control pins can be defined with an FPGA, rather than pull up and pull down resistors as shown in the schematic, if the delay is determined after board fabrication or if the delay requirement is dependant on the exact system configuration. Note that nEN, LEN, SETMIN, SETMAX are LVPECL levels by design but can be overdriven by LVCMOS input levels, as is done with the external pull ups and pull downs in this example.

FTUNE allows for interpolation of the total path delay between the resolution of the D[9:0] step size for higher frequency clocks. This pin has an RC low pass filter to suppress any noise coupled onto F_{TUNE} . F_{TUNE} can also be set with a voltage divider if the required delay is

known beforehand, but use of a DAC, as shown in the schematic allows for finer control of the delay. For lower frequency clocks this pin can instead be pulled to ground to set the analog delay to zero.

To achieve optimum jitter performance, device power supply isolation from the board supply is required. The ICS854S296I-33 provides separate V_{DD} and GND pins for optimum power filtering across the device.

In order to achieve the best possible filtering, it is highly recommended that the 0.1uF capacitors directly connected to the power and FTUNE pins be placed on the device side of the PCB as close to their corresponding pins as possible. This is represented by the placement of these capacitors in the schematic. If space is limited, the ferrite beads, 10uF and 0.1uF capacitor connected to 3.3V can be placed on the opposite side of the PCB. If space permits, place all filter components on the device side of the board.

Power supply filter recommendations are a general guideline to be used for reducing external noise from coupling into the devices. The filter performance is designed for a wide range of noise frequencies. This low-pass filter starts to attenuate noise at approximately 10kHz. If a specific frequency noise component is known, such as switching power supplies frequencies, it is recommended that component values be adjusted and if required, additional filtering be added. Additionally, good general design practices for power plane voltage stability suggests adding bulk capacitance in the local area of all devices.

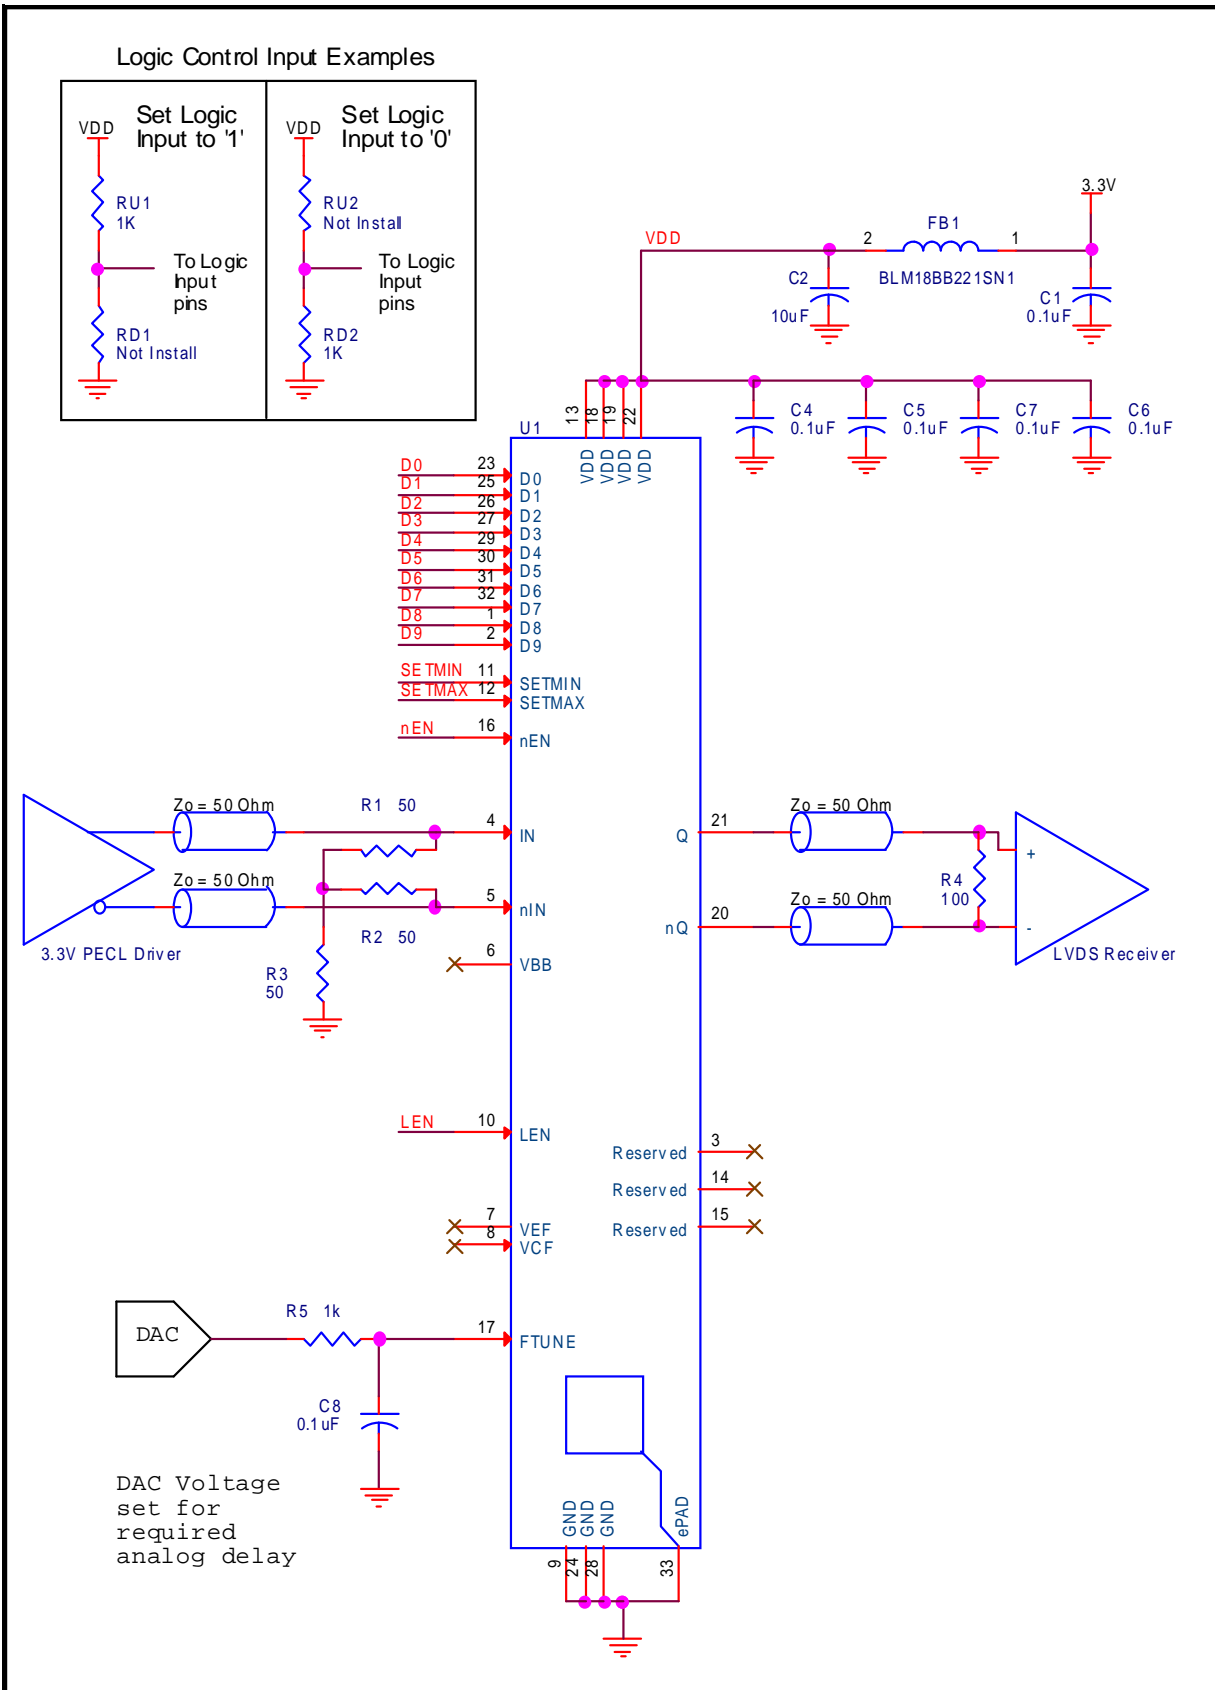

Figure 5. ICS854S296I-33 Application Schematic

Power Considerations

This section provides information on power dissipation and junction temperature for the ICS854S296I-33. Equations and example calculations are also provided.

1. Power Dissipation.

The total power dissipation for the ICS854S296I-33 is the sum of the core power plus the power dissipated in the load(s). The following is the power dissipation for $V_{DD} = 3.3V + 0.3V = 3.6V$, which gives worst case results.

The maximum current at 85°C is as follows:

$$I_{DD_MAX} = 150mA$$

- $Power_MAX = V_{DD_MAX} * I_{DD_MAX} = 3.6V * 150mA = 540mW$

2. Junction Temperature.

Junction temperature, T_j , is the temperature at the junction of the bond wire and bond pad, and directly affects the reliability of the device. The maximum recommended junction temperature is 125°C. Limiting the internal transistor junction temperature, T_j , to 125°C ensures that the bond wire and bond pad temperature remains below 125°C.

The equation for T_j is as follows: $T_j = \theta_{JA} * Pd_total + T_A$

T_j = Junction Temperature

θ_{JA} = Junction-to-Ambient Thermal Resistance

Pd_total = Total Device Power Dissipation (example calculation is in section 1 above)

T_A = Ambient Temperature

In order to calculate junction temperature, the appropriate junction-to-ambient thermal resistance θ_{JA} must be used. Assuming no air flow and a multi-layer board, the appropriate value is 39.5°C/W per Table 7 below.

Therefore, T_j for an ambient temperature of 85°C with all outputs switching is:

$$85^\circ C + 0.540W * 39.5^\circ C/W = 106.3^\circ C. \text{ This is below the limit of } 125^\circ C.$$

This calculation is only an example. T_j will obviously vary depending on the number of loaded outputs, supply voltage, air flow and the type of board (multi-layer).

Table 7. Thermal Resistance θ_{JA} for 32 Lead VFQFN, Forced Convection

| Meters per Second | θ_{JA} by Velocity | | |

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
