

Description

This 28-bit 1:2 registered buffer with parity is designed for 1.7V to 1.9V VDD operation.

All clock and data inputs are compatible with the JEDEC standard for SSTL_18. The control inputs are LVCMOS. All outputs are 1.8 V CMOS drivers that have been optimized to drive the DDR2 DIMM load. The ICSSSTUAF32865A operates from a differential clock (CLK and $\overline{\text{CLK}}$). Data are registered at the crossing of CLK going high, and $\overline{\text{CLK}}$ going low.

The device supports low-power standby operation. When the reset input ($\overline{\text{RESET}}$) is low, the differential input receivers are disabled, and undriven (floating) data, clock and reference voltage (VREF) inputs are allowed. In addition, when $\overline{\text{RESET}}$ is low all registers are reset, and all outputs except $\overline{\text{PTYERR}}$ are forced low. The LVCMOS $\overline{\text{RESET}}$ input must always be held at a valid logic high or low level.

To ensure defined outputs from the register before a stable clock has been supplied, $\overline{\text{RESET}}$ must be held in the low state during power up.

In the DDR2 RDIMM application, $\overline{\text{RESET}}$ is specified to be completely asynchronous with respect to CLK and $\overline{\text{CLK}}$. Therefore, no timing relationship can be guaranteed between the two. When entering reset, the register will be cleared and the outputs will be driven low quickly, relative to the time to disable the differential input receivers. However, when coming out of reset, the register will become active quickly, relative to the time to enable the differential input receivers. As long as the data inputs are low, and the clock is stable during the time from the low-to-high transition of $\overline{\text{RESET}}$ until the input receivers are fully enabled, the design of the ICSSSTUAF32865A must ensure that the outputs will remain low, thus ensuring no glitches on the output.

The device monitors both $\overline{\text{DCS0}}$ and $\overline{\text{DCS1}}$ inputs and will gate the Qn outputs from changing states when both $\overline{\text{DCS0}}$ and $\overline{\text{DCS1}}$ are high. If either $\overline{\text{DCS0}}$ and $\overline{\text{DCS1}}$ input is low, the Qn outputs will function normally. The $\overline{\text{RESET}}$ input has priority over the $\overline{\text{DCS0}}$ and $\overline{\text{DCS1}}$ control and will force the Qn outputs low and the $\overline{\text{PTYERR}}$ output high. If the DCS-control functionality is not desired, then the CSGateEnable input can be hardwired to ground, in which case, the setup-time requirement for DCS would be the same as for the other D data inputs.

The ICSSSTUAF32865A includes a parity checking function. The ICSSSTUAF32865A accepts a parity bit from the memory controller at its input pin PARIN, compares it with the data received on the D-inputs and indicates whether a parity error has occurred on its open-drain $\overline{\text{PTYERR}}$ pin (active LOW).

Features

- 28-bit 1:2 registered buffer with parity check functionality
- Supports SSTL_18 JEDEC specification on data inputs and outputs
- Supports LVCMOS switching levels on CSGateEN and $\overline{\text{RESET}}$ inputs
- Low voltage operation: VDD = 1.7V to 1.9V
- Available in 160-ball LFBGA package

Applications

- DDR2 Memory Modules
- Provides complete DDR DIMM solution with ICS98ULPA877A or IDTCSPUA877A
- Ideal for DDR2 400, 533, and 667

Ball Assignment

Signal Group	Signal Name	Type	Description
Ungated Inputs	DCKE0, DCKE1, DODT0, DODT1	SSTL_18	DRAM function pins not associated with Chip Select.
Chip Select Gated Inputs	D0 ... D21	SSTL_18	DRAM inputs, re-driven only when Chip Select is LOW.
Chip Select Inputs	$\overline{DCS0}$, $\overline{DCS1}$	SSTL_18	DRAM Chip Select signals. These pins initiate DRAM address/command decodes, and as such at least one will be low when a valid address/command is present. The register can be programmed to re-drive all D-inputs only (CSGateEN high) when at least one Chip Select input is LOW.
Re-Driven	Q0A...Q21A, Q0B...Q21B, $\overline{QCSnA,B}$ QCKEnA,B, QODTnA,B	SSTL_18	Outputs of the register, valid after the specified clock count outputs and immediately following a rising edge of the clock.
Parity Input	PARIN	SSTL_18	Input parity is received on pin PARIN and should maintain odd parity across the D0...D21 inputs, at the rising edge of the clock.
Parity Error	\overline{PTYERR}	Open Drain	When LOW, this output indicates that a parity error was output identified associated with the address and/or command inputs. PTYERR will be active for two clock cycles, and delayed by an additional clock cycle for compatibility with final parity out timing on the industry-standard DDR-II register with parity (in JEDEC definition).
Program Inputs	CSGateEN	1.8V LVCMOS	Chip Select Gate Enable. When HIGH, the D0..D21 inputs will be latched only when at least one Chip Select input is LOW during the rising edge of the clock. When LOW, the D0...D21 inputs will be latched and re-driven on every rising edge of the clock.
Clock Inputs	CLK, \overline{CLK}	SSTL_18	Differential master clock input pair to the register. The register operation is triggered by a rising edge on the positive clock input (CLK).
Miscellaneous Inputs	MCL, MCH		Must be connected to a logic LOW or HIGH.
	\overline{RESET}	SSTL_18	Asynchronous reset input. When LOW, it causes a reset of the internal latches, thereby forcing the outputs LOW. \overline{RESET} also resets the \overline{PTYERR} signal.
	VREF	0.9V nominal	Input reference voltage for the SSTL_18 inputs. Two pins (internally tied together) are used for increased reliability.

L	X or Floating	X or Floating	X or Floating	X or Floating	X or Floating	X or Floating	H

1 H = HIGH Voltage Level

L = LOW Voltage Level

X = Don't Care

↑ = LOW to HIGH

↓ = HIGH to LOW

2 PARIN arrives one clock cycle after the data to which it applies.

3 This transition assumes $\overline{\text{PTYERR}}$ is HIGH at the crossing of CLK going HIGH and $\overline{\text{CLK}}$ going LOW. If $\overline{\text{PTYERR}}$ is LOW, it stays latched LOW for two clock cycles or until $\overline{\text{RESET}}$ is driven LOW.

Absolute Maximum Ratings

Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Item		Rating
Supply Voltage, VDD		-0.5V to 2.5V
Input Voltage Range, Vi ¹		-0.5V to VDD + 2.5V
Output Voltage Range, Vo ^{1,2}		-0.5V to VDDQ + 0.5V
Input Clamp Current, IiK		±50mA
Output Clamp Current, IoK		±50mA
Continuous Output Clamp Current, Io		±50mA
Continuous Current through each VDD or GND		±100mA
Package Thermal Impedance (θ_{ja}) ³	0m/s Airflow	44.3° C/W
	1m/s Airflow	38.1° C/W
Storage Temperature		-65 to +150° C

1 The input and output negative voltage ratings may be exceeded if the ratings of the I/P and O/P clamp current are observed.

2 This current will flow only when the output is in the high state level $V_O > V_{DDQ}$.

3 The package thermal impedance is calculated in accordance with JESD 51.

Operating Characteristics

The $\overline{\text{RESET}}$ and CS $\overline{\text{GateEN}}$ inputs of the device must be held at valid levels (not floating) to ensure proper device operation. The differential inputs must not be floating unless $\overline{\text{RESET}}$ is LOW.

NOTES:

1. CL includes probe and jig capacitance.
2. IDD tested with clock and data inputs held at VDD or GND, and $I_o = 0mA$
3. All input pulses are supplied by generators having the following characteristics: PRR $\leq 10MHz$, $Z_o = 50\Omega$, input slew rate = $1 V/ns \pm 20\%$ (unless otherwise specified).
4. The outputs are measured one at a time with one transition per measurement.
5. $V_{TT} = V_{REF} = V_{DD}/2$
6. $V_{IH} = V_{REF} + 250mV$ (AC voltage levels) for differential inputs. $V_{IH} = V_{DD}$ for LVC MOS input.
7. $V_{IL} = V_{REF} - 250mV$ (AC voltage levels) for differential inputs. $V_{IL} = GND$ for LVC MOS input.
8. $V_{ID} = 600mV$.
9. tPLH and tPHL are the same as tPDM.

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
 - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
 - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
