

## Brief Description

The ZSSC3131 is a member of the ZSSC313x product family of CMOS integrated circuits designed for automotive/ industrial sensor applications. All family members are well suited for highly-accurate amplification and sensor-specific correction of resistive bridge sensor signals. An internal 16-bit RISC microcontroller running a correction algorithm compensates sensor offset, sensitivity, temperature drift, and non-linearity of the connected sensor element. The required calibration coefficients are stored by the one-pass calibration procedure in an on-chip EEPROM.

The ZSSC3131 is optimized for simple switch and cost-sensitive sensor applications. The integrated adjustable digital filter enables building fast-switching real-time applications as well as stabilized applications for switching input signals that are unstable or disrupted.

## Features

- Adjustable to nearly all resistive bridge sensor types: maximum analog gain of 105; maximum overall gain of 420
- Sample rate up to 200 Hz
- ADC resolution 13/14 bit
- Internal temperature compensation
- Integrated adjustable digital filter
- Digital compensation of sensor offset, sensitivity, temperature drift, and non-linearity
- Output options: ratiometric analog voltage output (5 - 95% maximum, 12.4 bit resolution) or ZACwire™ (digital One-Wire Interface (OWI))
- Sensor biasing by voltage
- High voltage protection up to 33 V
- Supply current: Max. 5.5mA
- Reverse polarity and short circuit protection
- Wide operation temperature range: -40 to +150°C
- Traceability by user-defined EEPROM entries

\* Note: I<sup>2</sup>C™ is a trademark of NXP.

\*\* FSO = Full Scale Output.

## Benefits

- Family approach offers the best fitting IC selection to build cost-optimized applications
- No external trimming components required
- Low number of external components needed
- PC-controlled configuration and One-Pass/ end-of-line calibration via I<sup>2</sup>C™\* or ZACwire™ interface: Simple, cost-efficient, quick, and precise
- High accuracy (0.25% FSO\*\* @ -25 to +85°C; 0.5% FSO @ -40 to +125°C)
- Optimized for automotive/industrial environments due to robust protection circuitries, excellent electromagnetic compatibility, and AEC-Q100 qualification

## Available Support

- Evaluation Kits
- Application Notes
- Mass Calibration System

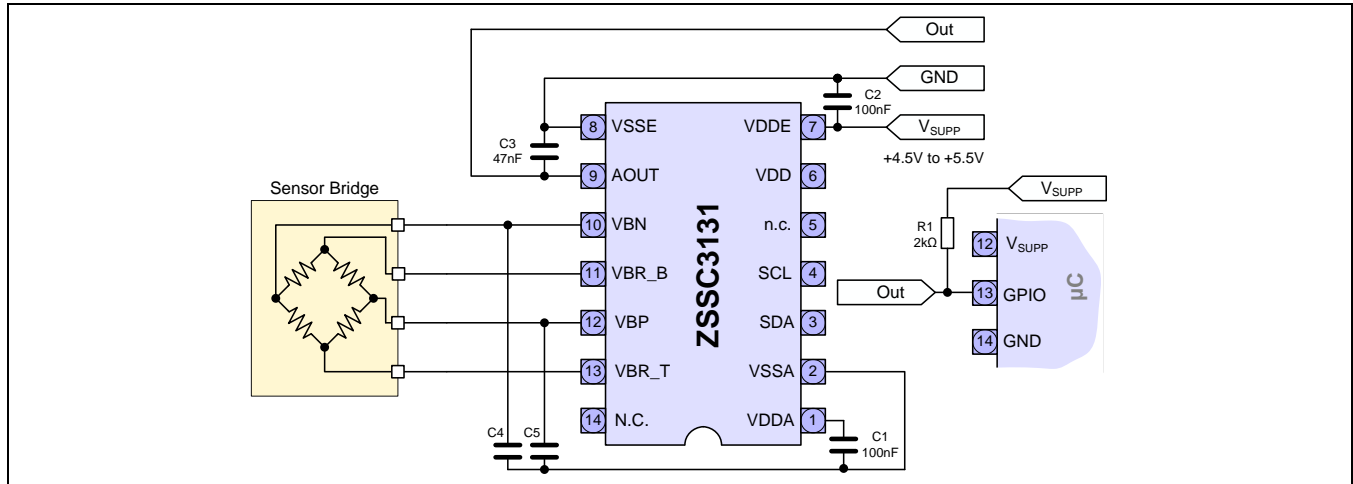

## Physical Characteristics

- Supply voltage 4.5 to 5.5 V
- Operation temperature: -40°C to +125°C (-40°C to +150°C extended temperature range depending on product version)
- Available in RoHS-compliant JEDEC-SSOP14 package or delivery as die

## ZSSC3131 Minimum Application Requirements

**ZSSC3131 Switch Application Example**

**Ordering Information** (See data sheet section 8 for complete delivery options.)

Product Sales Code	Description	Package
ZSSC3131BE1	ZSSC3131 die – tested; temperature range -40 to +150°C	Unsawn wafer: add “B” to sales code Die on frame: add “C” to sales code
ZSSC3131BA1	ZSSC3131 die – tested; temperature range -40 to +125°C	Unsawn wafer: add “B” to sales code Die on frame: add “C” to sales code
ZSSC3131BE2	ZSSC3131 SSOP14 – temperature range -40 to +150°C	Tube: add “T” to sales code Tape & Reel: add “R”

# 1 Electrical Characteristics

## 1.1. Absolute Maximum Ratings

**Note:** The absolute maximum ratings are stress ratings only. The device might not function or be operable above the operating conditions given in section 1.2. Stresses exceeding the absolute maximum ratings might also damage the device. In addition, extended exposure to stresses above the recommended operating conditions might affect device reliability. IDT does not recommend designing to the “Absolute Maximum Ratings.”

Parameters apply in operation temperature range and without time limitations.

**Table 1.1 Absolute Maximum Ratings**

No.	Parameter	Symbol	Conditions	Min	Max	Unit
1.1.1	Supply voltage <sup>1)</sup>	VDDE <sub>AMR</sub>	To VSSE, refer to section 3 for application circuits	-33	33	VDC
1.1.2	Potential at AOUT pin <sup>1)</sup>	V <sub>OUT</sub>	Referenced to VSSE	-33	33	VDC
1.1.3	Analog supply voltage <sup>1)</sup>	VDDA <sub>AMR</sub>	Referenced to VSSA, VDDE - VDDA < 0.35V	-0.3	6.5	VDC
1.1.4	Voltage at all analog and digital IO pins	V <sub>A_IO</sub> V <sub>D_IO</sub>	Referenced to VSSA	-0.3	VDDA + 0.3	VDC
1.1.5	Storage temperature	T <sub>STG</sub>		-55	150	°C

<sup>1)</sup> Refer to the ZSSC313x High Voltage Protection Description for specification and detailed conditions.

## 1.2. Operating Conditions

All voltages are referenced to VSSA.

**Table 1.2 Operating Conditions**

No.	Parameter	Symbol	Conditions	Min	Typ	Max	Unit
1.2.1	Ambient temperature <sup>1) 2)</sup>	T <sub>AMB_TQE</sub>	Extended Temperature Range (TQE)	-40		150	°C
		T <sub>AMB_TQA</sub>	Advanced-Performance Temperature Range (TQA)	-40		125	°C
		T <sub>AMB_TQI</sub>	Best-Performance Temperature Range (TQI)	-25		85	°C
1.2.2	Supply voltage	VDDE		4.5	5.0	5.5	VDC
1.2.3	Bridge resistance <sup>3) 4)</sup>	R <sub>BR</sub>		2		25	kΩ

1) Maximum operation temperature range depends on product version (refer to section 8).  
 2) See the temperature profile description in the ZSSC313x Technical Note—Die & Package Dimensions.  
 3) No measurement in mass production; parameter is guaranteed by design and/or quality observation.  
 4) Symmetric behavior and identical electrical properties (especially the low pass characteristic) of both sensor inputs of the ZSSC3131 are required. Unsymmetrical conditions of the sensor and/or external components connected to the sensor input pins of the ZSSC3131 can generate a failure in signal operation.

### 1.3. Electrical Parameters

All parameter values are valid under the operating conditions specified in section 1.2 (special definitions excluded). All voltages referenced to VSSA.

Note: See important notes at the end of Table 1.3.

**Table 1.3 Electrical Parameters**

No.	Parameter	Symbol	Conditions	Min	Typ	Max	Unit
<b>1.3.1. Supply Current and System Operation Conditions</b>							
1.3.1.1	Supply current	$I_S$	Without bridge and load current, $f_{OSC} \leq 3$ MHz			5.5	mA

1.4.1.6	Internal pull-up resistor <sup>1)</sup>	R <sub>PC,PULLUP</sub>		25		100	kΩ
<b>1.4.2. ZACwire™ One-Wire Interface (OWI)</b> (Refer to the ZSSC313x Functional Description for timing details)							
1.4.2.1	OWI voltage level HIGH <sup>1)</sup>	V <sub>OWI,HIGH</sub>		0.75			VDDA
1.4.2.2	OWI voltage level LOW <sup>1)</sup>	V <sub>OWI,LOW</sub>				0.2	VDDA
1.4.2.3	Slave output level LOW <sup>1)</sup>	V <sub>OWI,LOW_OUT</sub>	Open drain, I <sub>OL</sub> <2mA			0.15	VDDA
1.4.2.4	Start window <sup>1)</sup>	t <sub>OWI,STARTWIN</sub>	At f <sub>OSC</sub> =3MHz	96	175	455	ms
<b>1.4.3. EEPROM</b>							
1.4.3.1	Ambient temperature for EEPROM programming <sup>1)</sup>	T <sub>AMB_EEP</sub>		-40		150	°C
1.4.3.2	Write cycles <sup>1)</sup>	n <sub>EEP,WRI</sub>	Write ≤ 85°C			100 000	
			Write up to 150°C			100	
1.4.3.3	Read cycles <sup>1) 2)</sup>	n <sub>EEP,READ</sub>	≤175°C			8 * 10 <sup>8</sup>	
1.4.3.4	Data retention <sup>1) 3)</sup>	t <sub>EEP,RETENTION</sub>	1300h at 175°C ( = 3000h at 150°C + 27000h at 125°C + 100000h at 55°C)			15	a
1.4.3.5	Programming time <sup>1)</sup>	t <sub>EEP,WRI</sub>	Per written word		12		ms
<ol style="list-style-type: none"> <li>1) No measurement in mass production, parameter is guaranteed by design and/or quality observation.</li> <li>2) Valid for the dice. Note that the package and the temperature version cause additional restrictions.</li> <li>3) Over lifetime and valid for the dice. Use the calculation sheet ZSSC313x Temperature Profile Calculation Sheet for temperature stress calculation. Note that the package and the temperature version cause additional restrictions.</li> </ol>							

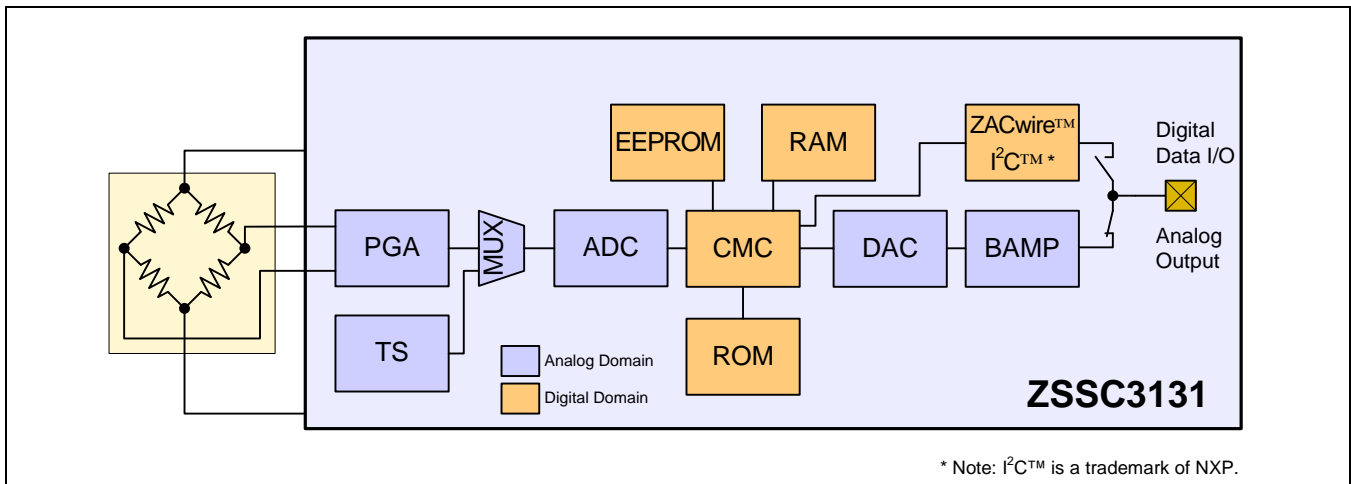

## 2 Circuit Description

### 2.1. Signal Flow

The ZSSC3131's signal path is partly analog and partly digital. The analog section is differential – this means the differential bridge sensor signal is internally handled via two signal lines that are rejected symmetrically around an internal common mode potential (analog ground =  $VDDA/2$ ).

As a result of the differential design, it is possible to amplify positive and negative input signals that are within the common mode range of the signal input.

**Figure 2.1** Block Diagram of the ZSSC3131

PGA	Programmable Gain Amplifier
TS	On-chip Temperature Sensor (pn-junction)
MUX	Multiplexer
ADC	Analog-to-Digital Converter
CMC	Calibration Microcontroller
ROM	Read-Only Memory for Correction Formula and Algorithm
RAM	Volatile Memory for Calibration Parameters and Configuration
EEPROM	Non-volatile Memory for Calibration Parameters and Configuration
DAC	Digital-to-Analog Converter
BAMP	Output Buffer Amplifier

The differential signal from the bridge sensor is pre-amplified by the programmable gain amplifier (PGA). The multiplexer (MUX) transmits the signals from either the bridge sensor or the internal temperature sensor to the analog-to-digital converter (ADC) in a specific sequence. The ADC converts these signals into digital values.

The digital signal conditioning is processed by the calibration microcontroller (CMC). It is based on a correction formula that uses sensor-specific coefficients determined during calibration. The formula is located in ROM, and the sensor-specific coefficients are stored in EEPROM. Depending on the programmed output configuration, the conditioned sensor signal is output as an analog signal or alternatively can be readout via a digital serial interface (I<sup>2</sup>C™ or ZACwire™). The configuration data and the correction parameters must also be programmed into the EEPROM via the digital interfaces.

## 2.2. Application Modes

For each application, a configuration set must be established by programming the on-chip EEPROM for the following modes:

- Sensor channel
  - Input range: The gain adjustment of the analog front-end (AFE) with respect to the maximum sensor signal span and the zero point of the A/D conversion must be selected.
  - Resolution/response time: The A/D converter must be configured for resolution. These settings influence the sampling rate and the signal integration time, and thus, the noise immunity.
- Temperature
  - Temperature measurement

## 2.3. Analog Front-End (AFE)

The analog front-end (AFE) consists of the three-stage programmable gain amplifier (PGA), the multiplexer (MUX), and the analog-to-digital converter (ADC).

### 2.3.1. Programmable Gain Amplifier (PGA)

Table 2.1 shows the adjustable gains, the sensor signal spans, and the valid common mode range.

**Table 2.1 Adjustable Gains, Resulting Sensor Signal Spans and Common Mode Ranges**

PGA Gain $a_{IN}$	Maximum Span $V_{IN\_SP}$ [mV/V] <sup>1)</sup>	Input Common Mode Range $V_{IN\_CM}$ [% VDDA]
105	7.1	29 to 65
70	10.7	29 to 65
52.5	14.3	29 to 65
35	21.4	29 to 65
26.3	28.5	29 to 65
14	53.75	29 to 65
9.3	80	29 to 65
7	107	29 to 65
2.8	267	32 to 57

1) Recommended maximum internal signal range is 75% of the supply voltage.  
Span is calculated by the following formula:  $Span = 0.75 (VBR\_T - VBR\_B) / Gain$ .

### 2.3.2. Offset Compensation

The ZSSC3131 processes a sensor-offset correction during the digital signal conditioning by the calibration microcontroller (CMC).

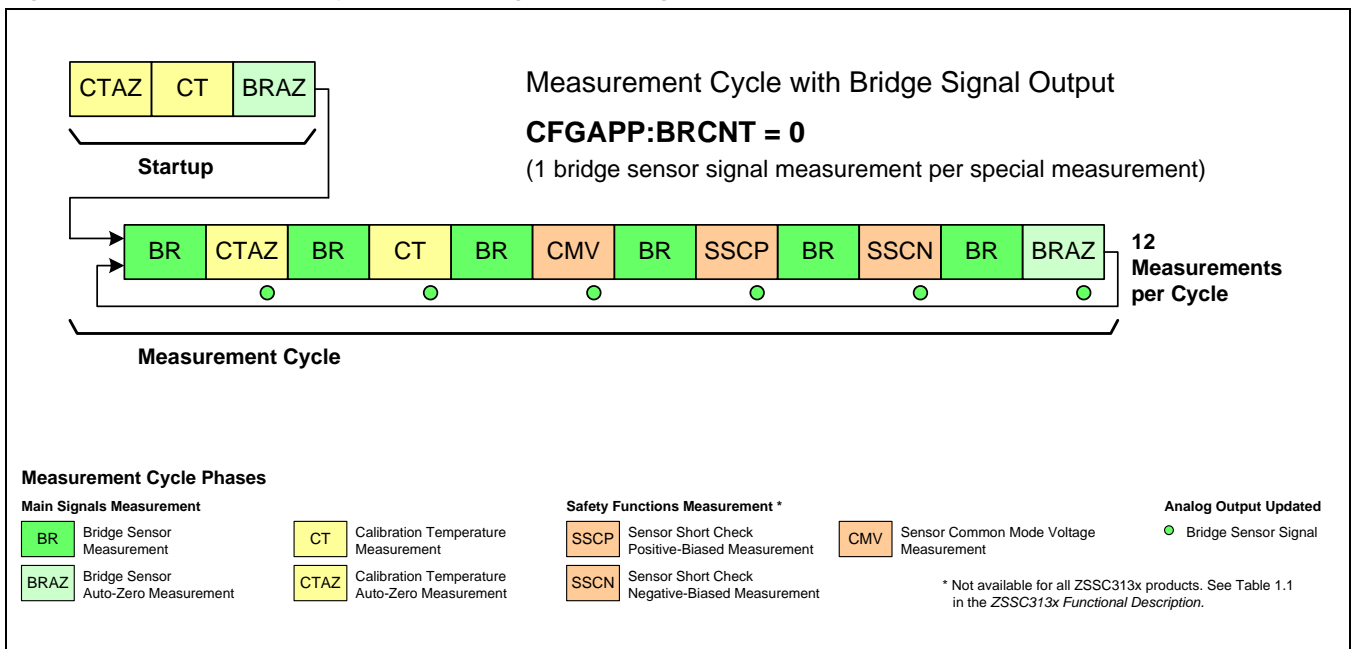

### 2.3.3. Measurement Cycle

The measurement cycle is controlled by the CMC. Depending on EEPROM settings, the multiplexer (MUX) selects the following input signals in a defined sequence:

- Pre-amplified bridge sensor signal
- Temperature sensor signal
- Internal offset of the input channel ( $V_{OFF}$ )

The cycle diagram in Figure 2.2 shows the basic structure of the measurement cycle. After power-on, the startup routine is processed, which performs all required measurements to expedite acquiring an initial valid conditioned sensor output. After the startup routine, the normal measurement cycle runs.

**Figure 2.2 Measurement Cycle with 1 Bridge Sensor Signal Measurement per Special Measurement**

### 2.3.4. Analog-to-Digital Converter

The A/D converter is implemented using full-differential switched-capacitor technique.

Programmable ADC resolutions are  $r_{ADC} = \langle 13, 14 \rangle$  bit.

The A/D conversion is integrating, inherently monotone, and insensitive to short and long term instability of the clock frequency. The conversion time  $t_{ADC}$  depends on the desired resolution and can be roughly calculated by equation (1):

$$t_{ADC} = \frac{2^{r_{ADC}}}{\left(\frac{f_{OSC}}{2}\right)} \quad (1)$$

Where

- $r_{ADC}$  Resolution of A/D conversion
- $f_{OSC}$  Frequency of internal oscillator (refer to 1.3.1)

Refer to the ZSSC313x *Bandwidth Calculation Sheet* for a detailed calculation of sampling time and bandwidth.

The result of the A/D conversion is a relative counter result Z corresponding to the following equation:

$$Z = 2^{r_{ADC}} \cdot \left(\frac{V_{ADC\_DIFF}}{V_{ADC\_REF}} - RS\right) \quad (2)$$

Where

- $r_{ADC}$  Resolution of A/D conversion
- $V_{ADC\_DIFF}$  Differential ADC input voltage
- $V_{ADC\_REF}$  ADC reference voltage as selected by the BRREF bits in the EEPROM configuration word CFGAPP ( $V_{VBR\_T} - V_{VBR\_B}$  if BRREF= 0) or ( $V_{VDDA} - V_{VSSA}$  if BRREF=1)\*
- RS Digital ADC Range Shift (RS = 1/16, 1/8, 1/4, 1/2) controlled by the ADCRS bits in the EEPROM configuration word CFGAFE) **Error! Bookmark not defined.**

With the RS value, a sensor input signal can be shifted in the optimal input range of the ADC.

The condition required for ensuring the specified accuracy, stability, and non-linearity parameters of the analog front-end is that the differential ADC input voltage  $V_{ADC\_DIFF}$  does not exceed the range of 10% to 90% of the ADC reference voltage  $V_{ADC\_REF}$ . This requirement must be met for the whole temperature range and for all sensor tolerances.

\* Refer to the ZSSC313x *Functional Description* for more information on EEPROM contents.

**Table 2.2 ADC Resolution versus Output Resolution and Sample Rate**

ADC Adjustment	Output Resolution <sup>1)</sup>		Sample Rate <sup>2)</sup>		Averaged Bandwidth <sup>2)</sup>	
	$r_{ADC}$ [bit]	Digital [bit]	Analog [bit]	$f_{osc}=3MHz$ [Hz]	$f_{osc}=4MHz$ [Hz]	$f_{osc}=3MHz$ [Hz]
13	13	12	345	460	130	172
14	14	12	178	237	67	89

1) Output resolution does not exceed ADC resolution. PGA gain should be such that the differential ADC input signal uses at least 50% of ADC input range to ensure maximum achievable output resolution.

2) Refer to the ZSSC313x *Bandwidth Calculation Sheet* for a detailed calculation of sampling time and bandwidth.

## 2.4. Temperature Measurement

The ZSSC3131 supports acquiring temperature data needed for conditioning of the sensor signal using an internal pn-junction temperature sensor. Refer to the *ZSSC313x Functional Description* for a detailed explanation of temperature sensor adaptation and adjustment.

## 2.5. System Control and Conditioning Calculation

The system control supports the following tasks/features:

- Managing the startup sequence
- Controlling the measurement cycle regarding to the EEPROM-stored configuration data
- Sensor signal conditioning (calculation of the 16-bit correction for each measurement signal using the EEPROM-stored conditioning coefficients and the ROM-based formulas)
- Processing communication requests received via the digital interfaces
- Performing failsafe tasks and message detected errors by setting diagnostic states

### 2.5.1. General Working Modes

ZSSC3131 supports three different working modes:

- Normal Operation Mode (NOM) – for continuous processing of signal conditioning
- Command Mode (CM) – for calibration and access to all internal registers
- Diagnostic Mode (DM) – for failure messages

### 2.5.2. Startup Phase \*

After power-on, the startup phase is processed, which includes

- Internal supply voltage settling including reset of the circuitry by the power-on reset block (POR). Refer to the *ZSSC313x High Voltage Protection Description* for power-on/off thresholds. Duration (beginning with  $V_{VDDA}-V_{VSSA}=0V$ ): 500 $\mu$ s to 2ms; AOUT: high impedance.
- System start and configuration, EEPROM readout, and signature check. Duration: ~200 $\mu$ s; AOUT: lower diagnostic range (LDR).

\* All timing values are roughly estimated for an oscillator frequency  $f_{osc}=3MHz$  and are proportional to that frequency.

- Processing the measurement cycle start routine.  
Duration: 5x A/D conversion time; AOUT behavior depends on configured one-wire communication mode (refer to section 2.6):  
OWIANA or OWIDIS → AOUT: lower diagnostic range (LDR)  
OWIWIN or OWIENA → AOUT: tri-state

If an error is detected during the startup phase, the Diagnostic Mode (DM) is activated and the analog output at the AOUT pin remains in the lower diagnostic range.

After the startup phase, the continuous running measurement and sensor signal conditioning cycle is started, and analog or digital output of the conditioned sensor signal is activated. If the one-wire communication mode OWIWIN is selected, the OWI startup window expires before analog output is available.

### 2.5.3. Conditioning Calculation

The digitalized value for the bridge signal is processed with a conditioning formula to remove offset and temperature dependency and to compensate nonlinearity up to 3<sup>rd</sup> order. The result is a non-negative 15-bit value for the measured bridge sensor signal in the range [0; 1). This value is available for readout via I<sup>2</sup>C™ or OWI communication. For the analog output, the value is clipped to the programmed output limits.

**Note:** The extent of signal deviation that can be compensated by the conditioning calculation depends on the specific sensor signal characteristics. For a rough estimation, assume the following: offset compensation and gain correction are not limited. Note that resolution of the digitally gained signal is determined by the ADC resolution in respect to the dynamic input range used. The temperature correction includes first and second order terms and should be adequate for practically all relevant cases. The non-linearity correction of the sensor signal is possible for second-order up to approximately 30% FS regarding ideal fit and for third-order up to about 20% FS. Overall, the conditioning formula applied is able to reduce the non-linearity of the sensor signal by a factor of 10.

## 2.6. Analog or Digital Output

The AOUT pin is used for analog output and for one-wire communication (OWI). The latter can be used for digital readout of the conditioned sensor signal and for end-of-line sensor module calibration. The ZSSC3131 supports different modes for the analog output in interaction with OWI communication as selected by EEPROM configuration or by command:

- OWIENA: Analog output is deactivated; OWI readout of the signal data is enabled.
- OWIWIN: Analog output starts after the startup phase and after the OWI startup window if OWI communication is not initiated; OWI communication for configuration or for end-of-line calibration can be started during the OWI startup window (maximum ~500ms) by sending the START\_CM command.
- OWIANA: Analog output starts after the startup phase; OWI communication for configuration or for end-of-line calibration can be started during the OWI startup window (maximum ~500ms) by sending the START\_CM command; for command transmission, the analog output driven at the AOUT pin must be overwritten by the external communication master (AOUT drive capability is current-limited).
- OWIDIS: Analog output starts after the startup phase; OWI readout of the signal data is disabled.

The analog output signal is driven by an offset compensated, rail-to-rail output buffer that is current-limited to prevent damage to the ZSSC3131 in the event of a short circuit between the analog output and power supply or ground. Output resolution of at least 12-bit in the range of 10% to 90% FS is ensured by a 12.4-bit resistor string DAC.

## **2.7. Serial Digital Interface**

The ZSSC3131 includes a serial digital I<sup>2</sup>C™ interface and a ZACwire™ interface for one-wire communication (OWI). The digital interfaces allow configuration and calibration of the sensor module. OWI communication can be used to perform an end-of-line calibration via the analog output pin AOUT of a completely assembled sensor module. The interfaces also provide the readout of the conditioned sensor signal data during normal operation.

Refer to the *ZSSC313x Functional Description* for a detailed description of the serial interfaces and the communication protocols.

## **2.8. Failsafe Features**

The ZSSC3131 detects various failures. When a failure is detected, Diagnostic Mode (DM) is activated. DM is indicated by setting the output pin AOUT to the Lower Diagnostic Range (LDR). When using digital serial communication protocols (I<sup>2</sup>C™ or OWI) to read conditioning results data, the error status is indicated by a specific error code.

A watchdog timer controls the proper operation of the microcontroller. The operation of the internal oscillator is monitored by an oscillator-failure detection circuit. EEPROM and RAM content are checked when accessed. Control registers are parity protected.

Refer to the *ZSSC313x Functional Description* for a detailed description of failsafe features and methods of error indication.

## **2.9. High Voltage, Reverse Polarity, and Short Circuit Protection**

The ZSSC3131 is designed for 5V power supply operation.

The ZSSC3131 and the connected sensor are protected from overvoltage and reverse polarity damage by an internal supply voltage limiter. The analog output AOUT can be connected (short circuit, overvoltage, and reverse polarity) with all potentials in the protection range under all potential conditions at the pins VDDE and VSSE.

To guarantee this operation, all external components (see application circuit in section 3) are required. The protection is not time-limited.

Refer to the *ZSSC313x High Voltage Protection Description* for a detailed description of protection cases and conditions.

### 3 Application Circuit Examples

The application circuits contain external components that are needed for overvoltage, reverse polarity, and short circuit protection.

**Note:** Also refer to *ZSSC313x Technical Note—EMC Design Guidelines* and other ZSSC313x application notes available on the ZSSC3131 product web page ([www.IDT.com/ZSSC3131](http://www.IDT.com/ZSSC3131)) for additional application examples and board layout recommendations.

**Table 3.1 External Components for Application Circuit Examples**

Symbol	Component	Min	Typ <sup>2)</sup>	Max	Unit	Remarks
C1	Capacitor	100		470	nF	
C2	Capacitor	100			nF	
C3 <sup>1)</sup>	Capacitor	4	47	160	nF	Value includes the load capacitor C3 and the capacitance of the connection cable.
C4, C5 <sup>1)</sup>	Capacitor	0		10	nF	Recommended to increase EMI immunity. Value includes the filter capacitor C4 and C5 and the sensor connection line capacitance.

- 1) Increasing capacitors C3, C4, and C5 increases EMI immunity.
- 2) Dimensioning is only for example and must be adapted to the requirements of the application.

**Figure 3.1 Application with On-Chip Diode Temperature Sensor**

## 4 Pin Configuration and Package

Table 4.1 Pin Configuration and Definition

Pin No	Pin Name	Description	Remarks
1	VDDA	Positive Analog Supply Voltage	Internal analog supply
2	VSSA	Negative Analog Supply Voltage	Internal analog ground
3	SDA	I <sup>2</sup> C™ Serial Data	Digital I/O; internal pull-up to VDDA
4	SCL	I <sup>2</sup> C™ Clock	Digital input; internal pull-up to VDDA
5	N.C.	Not connected	
6	VDD	Positive Digital Supply Voltage	Internal digital supply
7	VDDE	Positive External Supply Voltage	High voltage analog supply
8	VSSE	Negative External Supply Voltage	Ground
9	AOUT	Analog Output and ZACwire™ Serial Data	High voltage analog I/O
10	VBN	Negative Input from Sensor Bridge	Analog input
11	VBR_B	Negative Sensor Bridge Supply Voltage	Analog I/O Depending on application circuit, short to VSSA
12	VBP	Positive Input from Sensor Bridge	Analog input
13	VBR_T	Positive Sensor Bridge Supply Voltage	Analog I/O Depending on application circuit, short to VDDA
14	N.C.	Not connected	

The standard package of the ZSSC3131 is an RoHS-compliant SSOP14 “green” package (5.3mm body width) with a lead pitch of 0.65 mm.

Figure 4.1 ZSSC3131 SSOP14 Pin Diagram

## **5 ESD Protection**

All pins have an ESD protection of >2000V according to the Human Body Model (HBM). The pins VDDE, VSSE and AOUT have an additional ESD protection of >4000V (HBM).

ESD protection is tested with devices in SSOP14 packages during product qualification. The ESD test follows the Human Body Model with 1.5kOhm/100pF based on MIL 883, Method 3015.7.

## **6 Quality and Reliability**

The ZSSC3131 is qualified according to the AEC-Q100 standard, operating temperature grade 0.

A fit rate <5fit (T=55°C, S=60%) is guaranteed. A typical fit rate of the semiconductor technology used is 2.5fit.

## **7 Customization**

For high-volume applications that require an upgraded or downgraded functionality compared to the ZSSC3131, IDT can customize the circuit design by adding or removing certain functional blocks.

Please contact IDT for further information.

## 8 Ordering Information

Product Sales Code	Description	Package
ZSSC3131BA2T	ZSSC3131 SSOP14 – temperature range -40 to +125°C	Tube
ZSSC3131BA2R	ZSSC3131 SSOP14 – temperature range -40 to +125°C	Reel
ZSSC3131BA1B	ZSSC3131 die – temperature range -40 to +125°C	Tested dice on unsawn wafer

## 10 Glossary

Term	Description
ADC	Analog-to-Digital Converter
AEC	Automotive Electronics Council
AFE	Analog Front-end
AOUT	Analog Output
BAMP	Buffer Amplifier
BR	Bridge Sensor Signal
CM	Command Mode
CMC	Calibration Microcontroller
CMOS	Complementary Metal Oxide Semiconductor

Term	Description
DAC	Digital-to-Analog Converter
DM	Diagnostic Mode
EEPROM	Electrically Erasable Programmable Read-Only Memory
ESD	Electrostatic Device
LDR	Lower Diagnostic Range
MUX	Multiplexer
NOM	Normal Operation Mode
OWI	One-Wire Communication
PGA	Programmable Gain Amplifier
POR	Power-on Reset
RAM	Random-Access Memory
RISC	Reduced Instruction Set Computer
ROM	Read-Only Memory
SSC	Sensor Signal Conditioner or Sensor Short Check depending on context.
T	Temperature Sensor Signal
TS	Temperature Sensor

## 11 Document Revision History

Revision	Date	Description
1.00	October 18, 2011	First released revision.
1.10	January 20, 2012	Full revision.
1.20	September 25, 2012	Minor edits. Update for IDT contact information.
1.21	February 15, 2013	Updates to specifications in section 1.3.6. Addition of RS factor (ADC Range Shift) to equation (2). Minor edits. Update for ZMD America contact information.
1.22	October 21, 2013	Updates for contact information and imagery for cover and headers. Updates for available part codes. Updates for related documents. Minor edits for clarity.
1.23	April 21, 2014	Update to description for kits: software is no longer included. It is downloaded from the product page <a href="http://www.IDT.com/ZSSC3131">www.IDT.com/ZSSC3131</a> . ZSSC313x Evaluation Kit is now version 2.0. Updates for related documents section.
1.24	April 10, 2015	Update for contact information and related documents section.
	January 25, 2016	Changed to IDT branding.

## Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.
2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.
3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.
4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.
5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.
  - "Standard": Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.
  - "High Quality": Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.
6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.
7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or danger to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.
8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.
9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.
10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.
11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.
12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
