Description

The 8Axxxx 144BGA EVK is designed to help customers evaluate IDT ClockMatrix devices. This document discusses the following about the EVK:

- Introduces the board and its power supply and jumper settings
- Describes the input and output connectors for normal operation
- Explains how to bring up the board using the Timing Commander software GUI
- Discusses how to configure and program the board to generate standard-compliant frequencies

Requirements

- IDT Timing Commander Software Installed (available at www.idt.com/timingcommander)
- ClockMatrix GUI (available at www.idt.com/clockmatrix)
- USB 2.0 or USB 3.0 interface
- Windows XP SP3 or later
- Processor: Minimum 1GHz
- Memory: Minimum 512MB; recommended 1GB
- Available disk space: Minimum 600MB (1.5GB 64-bit); recommended 1GB (2GB 64-bit)
- Network access during installation if the .NET framework is not currently installed on the system

Kit Contents

- 8A34xxx 144BGA Evaluation Board
- USB Type A cable

8A3xxxx 144BGA EVK Board
Important Notes

Disclaimer
Integrated Device Technology, Inc. and its affiliated companies (herein referred to as “IDT”) shall not be liable for any damages arising out of defects resulting from
(i) delivered hardware or software
(ii) non-observance of instructions contained in this manual and in any other documentation provided to user, or
(iii) misuse, abuse, use under abnormal conditions, or alteration by anyone other than IDT.

TO THE EXTENT PERMITTED BY LAW, IDT HEREBY EXPRESSLY DISCLAIMS AND USER EXPRESSLY WAIVES ANY AND ALL WARRANTIES, WHETHER EXPRESS, IMPLIED, OR STATUTORY, INCLUDING, WITHOUT LIMITATION, IMPLIED WARRANTIES OF MERCHANTABILITY AND OF FITNESS FOR A PARTICULAR PURPOSE, STATUTORY WARRANTY OF NON-INFRINGEMENT, AND ANY OTHER WARRANTY THAT MAY ARISE BY REASON OF USAGE OF TRADE, CUSTOM, OR COURSE OF DEALING.

Important Equipment Warning: Ensure the correct connection of all cables. Supplying the board using the wrong polarity could result in damage to the board and/or the equipment. Check that all jumpers have been removed from the board before applying power.

1. Usage Guide

1.1 Board Overview

The following diagram identifies various components of the board: input and output SMA connectors, power supply jacks, and some jumper settings necessary for the board operations.

**Figure 1. Overview of 144BGA ClockMatrix Evaluation Board**

Detailed descriptions of the board are as follows.

- **Input SMA Connectors** – There are eight differential inputs labeled CLK0/nCLK0–CLK7/nCLK7. Each input clock can be configured differentially (LVDS, PECL 2.5V, and PECL 3.3V) or in single-ended format (CMOS).

- **Output SMA Connectors** – There are 12 outputs labeled as Q0/nQ0–Q11/nQ11. Each output clock can be configured differentially (LVDS, LVPECL, or user-defined amplitude), or in single-ended format (LVCMOS – in-phase or out-of-phase).

- **GPIO switch, LEDs, and test points** – There are 16 GPIOs available. Each GPIO can be set a “low” or “high” level (if input) or displayed with an LED (if output). Some GPIOs are used to set the chip in a certain working condition on power-up. For more information, see GPIO Switches, LEDs, and Test Points.

- **USB connector** – A USB mini-connector connects the evaluation board to a PC for GUI communications. No power is drawn from the USB connector other than to power the FTDI USB chip.
• VCCO voltage selection jumpers – Each output voltage can be individually supplied with 1.8V, 2.5V, or 3.3V. These jumpers are used to select the voltage for the output voltages.
• Reset button – A small button is used to reset the board.
• OSC Input connector – An SMA connector, J45, can optionally supply a clock signal to overdrive the crystal.
• OCXO/TCXO reference – An SMA connector, J46, can supply a local OCXO/TCXO reference as an optional reference for System DPLL.
• Crystal – A crystal of various frequencies must be present for board operations. A 3225 footprint is provided for SMT crystals. For easy plug-in of a canned crystal, two through holes are also available.
• EEPROM – An SO-8 socket is provided to hold an EEPROM device of compatible package. EEPROM is used to store firmware and customer configuration data, if needed.

1.2 Board Power Supply

The board uses a single +5V supply for its power supplies. When running the board, set the bench power supply at 5V/2A. The red jack (J1) is positive; the black jack (J2) is the ground.

Multiple LDOs are used to generate 3.3V, 2.5V, and 1.8V from the +5V supply.

1.3 Voltage Selection Jumpers

There are nine headers/jumpers to select different voltages for different functional blocks of the chip. Each head is labeled pin 1 and pin 3 – jumping pin 1 and pin 2 will select 3.3V; jumping pin 2 and pin 3 will select 2.5V; no jumper will have 1.8V.

Please see the following example for JP4 and JP9 – JP4 will select 2.5V; JP9 will select 3.3V.

Figure 2. Example of Voltage Jumpers
The following list shows which head/jumper is used to select what voltage:

- JP1 – VDDD
- JP2 – VDDA
- JP3 – VCC_GPIO_DC
- JP4 – VDDO_Q8_3_5
- JP5 – VDDO_Q2_4_11
- JP6 – VDDO_1_10_7
- JP7 – VDD_CLK0
- JP8 – VDD_CLK1
- JP9 – VDDO_Q0_9_6

**Important Equipment Warning:** VDD_FOD voltage is selected by resistors R908 and R909. In order to prevent damage to the device, both R908 and R909 should not be stuffed, in which case VDD_FOD = 1.8V.

### 1.4 GPIO Switches, LEDs, and Test Points

Two 8-bit dip switches sets the logic levels for 16 GPIOs. The following table shows the GPIO levels for each setting and the corresponding LED state.

<table>
<thead>
<tr>
<th>Dip Switch Position</th>
<th>GPIO Logic Level</th>
<th>LED</th>
</tr>
</thead>
<tbody>
<tr>
<td>Left</td>
<td>Low</td>
<td>On</td>
</tr>
<tr>
<td>Center</td>
<td>High if GPIO is configured as Input</td>
<td>High if GPIO is configured as Input</td>
</tr>
<tr>
<td></td>
<td>High or Low according to the GPIO output setting</td>
<td>High or Low according to the GPIO output setting</td>
</tr>
<tr>
<td>Right</td>
<td>High</td>
<td>Off</td>
</tr>
</tbody>
</table>

Please see the picture and labels in Figure 3.

When the GPIOs are configured as outputs (such as User-Controlled or LOL indicator), the dip switch for the corresponding GPIO should be placed in the center position. The LED will indicate the state of the GPIO.
1.5 USB Jack
The board has a USB mini-connector. The other end of the USB cable is a USB Type A connector going to a PC.

1.6 Onboard EEPROM
An onboard EEPROM is used to store device firmware and/or customer's configuration data. There are two headers/jumpers, JP10 and JP11, used to select the I²C communication paths for the EEPROM.

Table 2. EEPROM I²C Connections

<table>
<thead>

2. Working with Timing Commander™ for Programing/Configuration

The following sections are best cross-referenced with the ClockMatrix GUI Step-by-Step User Guide which is available on www.idt.com.

2.1 Default Operation

The board can operate off an EEPROM that has stored all information including firmware and a default configuration data. A default operation provides a sanity check on the board before running the board through the IDT Timing Commander. Please set the board in the following default conditions (see Figure 4 for jumper and switch positions).

- Set all the GPIOs to the center position. This will ensure that GPIO8 and GPIO9 are high and that the serial port is configured for I²C 1-byte addressing.
- VDDA = 3.3V, VCC_GPIO_DC = 3.3V, and VDDO_Qx = 3.3V
- Crystal frequency = 50MHz
- CLK0 = 25MHz
- EEPROM is connected to ClockMatrix chip through an I²C bus by jumping Pin 2 and 3 of JP10 and JP11

With the above default conditions ready, connect the board to the PC using a USB type A to USB mini cable, and power up the board using a single +5V supply. On power-up, the ClockMatrix chip will read its firmware and configuration data from EEPROM and update all registers. When this process is completed, the following frequencies are available:

Q0 = 122.88MHz
Q1 = 122.88MHz

![Figure 4. Board Setting for Default Operation](image)

Important Equipment Warning: In order to set GPIO8 and GPIO9 to “High”, the switches for GPIO8 and GPIO9 must be set either to the “+” (high) position or the center position.
2.2 Using Timing Commander to Control the Board

Once the default operation is successful, complete the following steps to configure and program the ClockMatrix device per your specific application requirements using Timing Commander GUI tools:

1. Power up the board and set the main serial port in I\(^2\)C mode by GPIO9 = “high”. Set GPIO8 = “High”. Connect the board to the PC.

2. Start the Timing Commander software. You will see options of “New Setting File” and “Open Setting file”. For a new configuration, select “New Setting File”.

Figure 5. Starting Up Timing Commander GUI
3. After selecting “New Settings File”, a device selection window will pop up. In the window, choose the intended device in the list (in this example, 8A34001 is selected). Click the button at the lower right corner of the window (red circle) to browse and select the correct personality file (in this example, personality v4.6 is selected). Click OK.

Figure 6. Selecting 8A34001 using Personality File v4.6
4. The GUI window with the 8A34001 block diagram will open for configurations; or if “Open Settings File” is selected in Step 3, you will be prompted to browse and select an existing .tcs file and the personality file. When the configuration file is open, all configured values will be displayed (see Figure 7).

**Figure 7. Timing Commander GUI with a Settings File Opened**
5. In order to connect the board with Timing Commander (PC), click the button (red circle) at the up-right corner of the GUI to set up the communication protocols (see Figure 7).

After I²C and one-byte addressing are selected, click OK to close the window.

**Figure 8. Setting I²C for Connecting the Board with GUI**

![Connection Settings](image)

6. Click on the chip symbol at the upper-right corner to initiate the connection. The connection is valid when a green band appears at the upper-right corner of the window, as shown below.

**Figure 9. A Green Band appears when a Valid Connection is Made**

![Connection Settings](image)
7. If ClockMatrix chip's firmware, or firmware loaded from EEPROM, has a different version from that in the Personality file, a firmware version mismatch warning message will appear. Click “Close” button to close the message window and a connection is made.

**Figure 10. Firmware Version Mismatch Warning Message**

The firmware version on the device (4.5.0.10035) does not match the expected version (4.6.0.13472). Please click the Firmware Utility button and update the firmware on the device.

8. Once the connection is made, the firmware version can be read within the GUI. Click the “Firmware Utility” button to bring up the Firmware Utility window, as shown below.

**Figure 11. Reading Firmware Version**
9. Within the Firmware Utility window, click the “Get Firmware Version” button to read the firmware version.

**Figure 12. Read Firmware Version of ClockMatrix Chip**

10. In the case where the firmware version mismatches each other, a firmware upgrade is necessary to update the chip's firmware. To do so, complete the steps in How to Upgrade the Firmware to update the chip's firmware.
2.3 Output Terminations and Rework to Take 1PPS Input

All outputs are terminated with a 100Ω resistor across the output pair. This is the recommended termination regardless of the Voffset and Vswing settings. Since the outputs are DC-coupled, they will support a 1PPS output without any need for rework.

**Important Equipment Warning:** When connecting the outputs to measurement equipment, use a DC-block to ensure that the output operates at its intended Voffset. Otherwise, the equipment may load the output down and cause degraded performance.

The following rework must be implemented in order to support a 1PPS input clock. All input clocks for this board are ac-coupled and terminated as in the following figure.

**Figure 13. AC Coupling and Terminations for Input Clock**

For a 1PPS input, a single-ended input with DC-coupling is recommended. As such, the populated AC-coupling capacitor must be removed and the input must be configured as LVCMOS, not differential.

1. In Figure 13, to make CLK0 supportive of 1PPS input, first configure CLK0 as LVCMOS in Timing Commander (see Figure 14).

**Figure 14. Configuring CLK0 as CMOS to Receive a 1PPS Input**

2. Once in LVCMOS mode, CLK0_P and CLK0_N will be two separate LVCMOS inputs instead of a differential pair. To make CLK0_P receive a 1PPS input, replace C881 with a 0Ω resistor; and at the same time, remove R765 and R770.
3. How to Upgrade the Firmware

3.1 Upload Firmware to the RAM

1. Connect to the EVK board.
2. Power up the board with no EEPROM present. This ensures the firmware is 4.0.2.7017, as displayed in the figure.
3. The GUI will indicate that the firmware on the chip does not match the GUI firmware. Press “Close”.

4. Open the "Firmware Utility" window by clicking on the button as follows.

5. Update the Firmware first. Press "Update RAM to Current FW Only".
6. In the next window, press “Yes” and wait around 3-4 minutes.

   ![Update firmware window]

   **Update the firmware on the chip with version 4.6.0.13403 of the firmware?**

   **NOTE:** This can take around 4 minutes. There will be no progress indication during these operations.

7. Once the firmware is updated, the following window will indicate a successful update. Click “Close”.

   ![Success message]

   **Success (time == 109.919)**

8. Press “Get Firmware Version” to verify that the RAM was updated correctly, then click “Close”.

   ![Firmware Utility window]
3.2 Upload Firmware into the EEPROM

1. Once the firmware has been updated to the chip (steps 1 to 8), install the EEPROM on the EVK board.
2. Press “Write Firmware to EEPROM Only”.

3. In the next window, press “Yes”.

NOTE: Writing the firmware to the EEPROM takes ~6 minutes. Verifying the firmware on the EEPROM takes ~2.5 minutes. There will be no progress indication during these operations.
4. When asked to “Verify” the EEPROM, press “No”.

![Verify the firmware after writing? Verifying the EEPROM data makes the update take a little longer.]

5. In the next window, press “Close” to start the EEPROM write.

![About to write to EEPROM (pipeline 13472). Press Close to begin.]

6. Wait about 5 minutes for the EEPROM write to complete. Click “Close” in the following window.

![Wrote firmware EEPROM (pipeline 13403). time=-300.352.]

3.3 Verify the EEPROM Programming

7. Power cycle the board.
8. Disconnect and reconnect to the chip.
9. Read back the firmware version to ensure it is correct (see steps 3 to 7).

Notice

1. Descriptions of circuits, software and other related information in this document are provided only to illustrate the operation of semiconductor products and application examples. You are fully responsible for the incorporation or any other use of the circuits, software, and information in the design of your product or system. Renesas Electronics disclaims any and all liability for any losses and damages incurred by you or third parties arising from the use of these circuits, software, or information.

2. Renesas Electronics hereby expressly disclaims any warranties against and liability for infringement or any other claims involving patents, copyrights, or other intellectual property rights of third parties, by or arising from the use of Renesas Electronics products or technical information described in this document, including but not limited to, the product data, drawings, charts, programs, algorithms, and application examples.

3. No license, express, implied or otherwise, is granted hereby under any patents, copyrights or other intellectual property rights of Renesas Electronics or others.

4. You shall not alter, modify, copy, or reverse engineer any Renesas Electronics product, whether in whole or in part. Renesas Electronics disclaims any and all liability for any losses or damages incurred by you or third parties arising from such alteration, modification, copying or reverse engineering.

5. Renesas Electronics products are classified according to the following two quality grades: "Standard" and "High Quality". The intended applications for each Renesas Electronics product depends on the product's quality grade, as indicated below.

*Standard*: Computers; office equipment; communications equipment; test and measurement equipment; audio and visual equipment; home electronic appliances; machine tools; personal electronic equipment; industrial robots; etc.

*High Quality*: Transportation equipment (automobiles, trains, ships, etc.); traffic control (traffic lights); large-scale communication equipment; key financial terminal systems; safety control equipment; etc.

Unless expressly designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not intended or authorized for use in products or systems that may pose a direct threat to human life or bodily injury (artificial life support devices or systems; surgical implantations; etc.), or may cause serious property damage (space system; undersea repeaters; nuclear power control systems; aircraft control systems; key plant systems; military equipment; etc.). Renesas Electronics disclaims any and all liability for any damages or losses incurred by you or any third parties arising from the use of any Renesas Electronics product that is inconsistent with any Renesas Electronics data sheet, user's manual or other Renesas Electronics document.

6. When using Renesas Electronics products, refer to the latest product information (data sheets, user's manuals, application notes, "General Notes for Handling and Using Semiconductor Devices" in the reliability handbook, etc.), and ensure that usage conditions are within the ranges specified by Renesas Electronics with respect to maximum ratings, operating power supply voltage range, heat dissipation characteristics, installation, etc. Renesas Electronics disclaims any and all liability for any malfunctions, failure or accident arising out of the use of Renesas Electronics products outside of such specified ranges.

7. Although Renesas Electronics endeavors to improve the quality and reliability of Renesas Electronics products, semiconductor products have specific characteristics, such as the occurrence of failure at a certain rate and malfunctions under certain use conditions. Unless designated as a high reliability product or a product for harsh environments in a Renesas Electronics data sheet or other Renesas Electronics document, Renesas Electronics products are not subject to radiation resistance design. You are responsible for implementing safety measures to guard against the possibility of bodily injury, injury or damage caused by fire, and/or disaster to the public in the event of a failure or malfunction of Renesas Electronics products, such as safety design for hardware and software, including but not limited to redundancy, fire control and malfunction prevention, appropriate treatment for aging degradation or any other appropriate measures. Because the evaluation of microcomputer software alone is very difficult and impractical, you are responsible for evaluating the safety of the final products or systems manufactured by you.

8. Please contact a Renesas Electronics sales office for details as to environmental matters such as the environmental compatibility of each Renesas Electronics product. You are responsible for carefully and sufficiently investigating applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive, and using Renesas Electronics products in compliance with all these applicable laws and regulations. Renesas Electronics disclaims any and all liability for damages or losses occurring as a result of your noncompliance with applicable laws and regulations.

9. Renesas Electronics products and technologies shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable domestic or foreign laws or regulations. You shall comply with any applicable export control laws and regulations promulgated and administered by the governments of any countries asserting jurisdiction over the parties or transactions.

10. It is the responsibility of the buyer or distributor of Renesas Electronics products, or any other party who distributes, disposes of, or otherwise sells or transfers the product to a third party, to notify such third party in advance of the contents and conditions set forth in this document.

11. This document shall not be reprinted, reproduced or duplicated in any form, in whole or in part, without prior written consent of Renesas Electronics.

12. Please contact a Renesas Electronics sales office if you have any questions regarding the information contained in this document or Renesas Electronics products.

(Note1) "Renesas Electronics" as used in this document means Renesas Electronics Corporation and also includes its directly or indirectly controlled subsidiaries.

(Note2) "Renesas Electronics product(s)" means any product developed or manufactured by or for Renesas Electronics.
